

Usually you can rely on Apple Weather for real-time temperature updates and accurate forecasts. However, it's possible for something to go wrong and cause your Apple Watch to stop updating the Weather app.

Luckily, we've put together a guide of tried and tested solutions to get your Weather app back up and running.

## Table of Content

- [4. Unpair Apple Watch from iPhone and re-pair it](#)

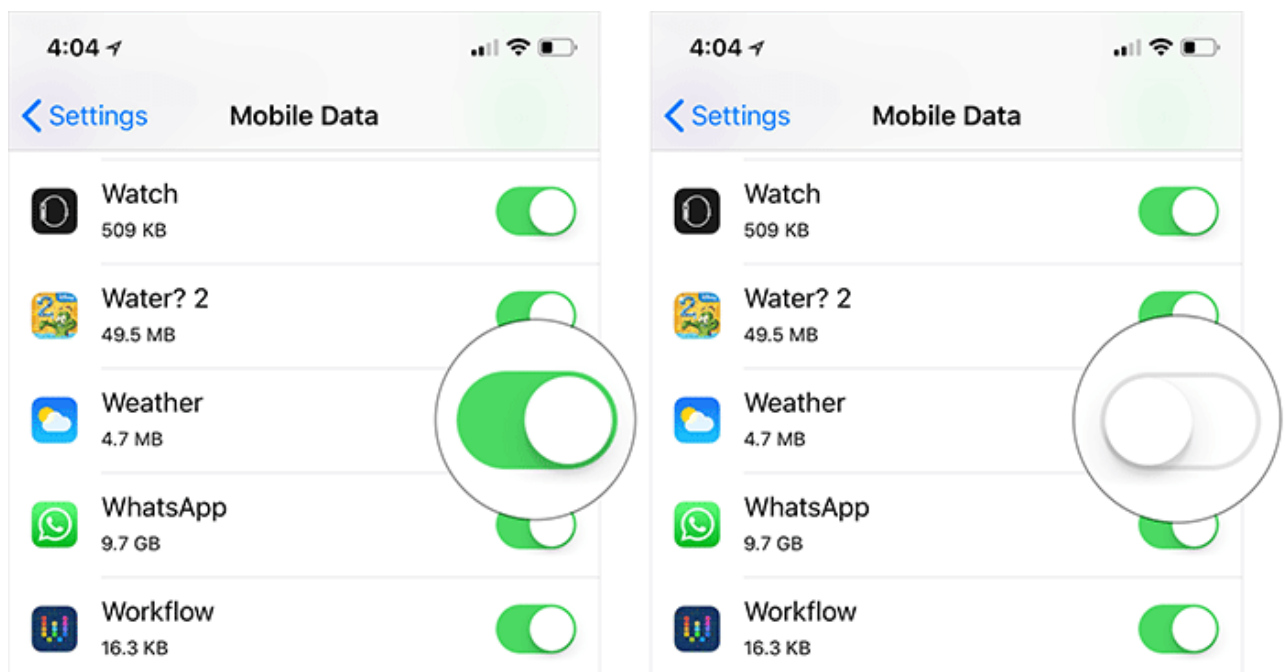

## 1. Restart Apple Watch and iPhone

Make sure that the Weather app has access to Cellular Data (if you're using it on your iOS

device.)

If you're using cellular on your iPhone, make sure the Weather app has access to your data. If it's already allowed to use data, disallow it and then restart both your watch and smartphone. Then, allow the app to use Cellular Data again.

1. Open **Settings** on your paired iPhone.
2. Now, tap **Mobile/Cellular**.
3. Scroll down and turn off the switch next to **Weather**.

4. Next, **restart** both your iOS device and Apple Watch:
  - On **iPhone X and later**, you need to press and hold both the side button and volume down button. Then, slide to power off.

- On your **iPhone 8/8 Plus or earlier**, press and hold the side button. Then, slide to power off.
- Wait for some time and then press and hold the side button again to **turn on your iPhone**.
- To **restart your smartwatch**, press and hold the side button. Then, drag the slider to turn off the watch.

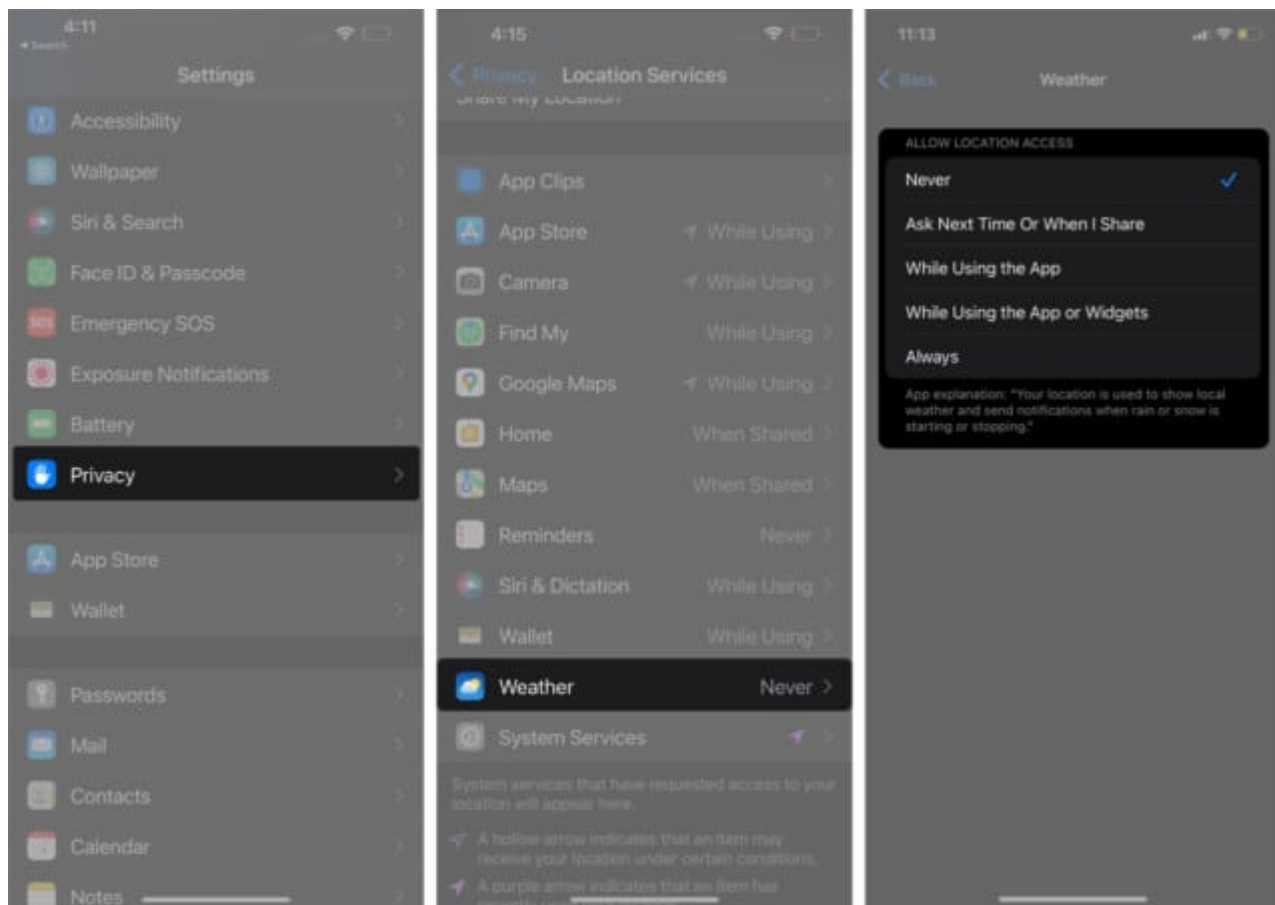

- After a few seconds, press and hold the side button again until the **Apple logo** shows up.
- 5. Next up, go back to **Settings** → **Cellular** → and then turn on the switch next to the Weather app.

Did this quick restart fix your Apple Watch Weather not updating? If you weren't so lucky, try out the next tip.

## 2. Ensure Weather app has access to your location

The app needs to have access to your location to show localized weather info. So, make sure your i's are dotted and your t's are crossed.

1. Open **Settings** on your paired iPhone → Tap **Privacy**.
2. Tap **Location Services** → **Weather**.
3. Now, you have five options:
  - Never
  - Ask Next Time or When I Share
  - While Using the App
  - While Using the App or Widgets
  - Always

Select **Always** for best results, or **While Using the App or Widgets** if you tend to glance at the widget on your homescreen for the forecast.

Hopefully, this was the answer to your problems. Otherwise, maybe the next solution will help you out.

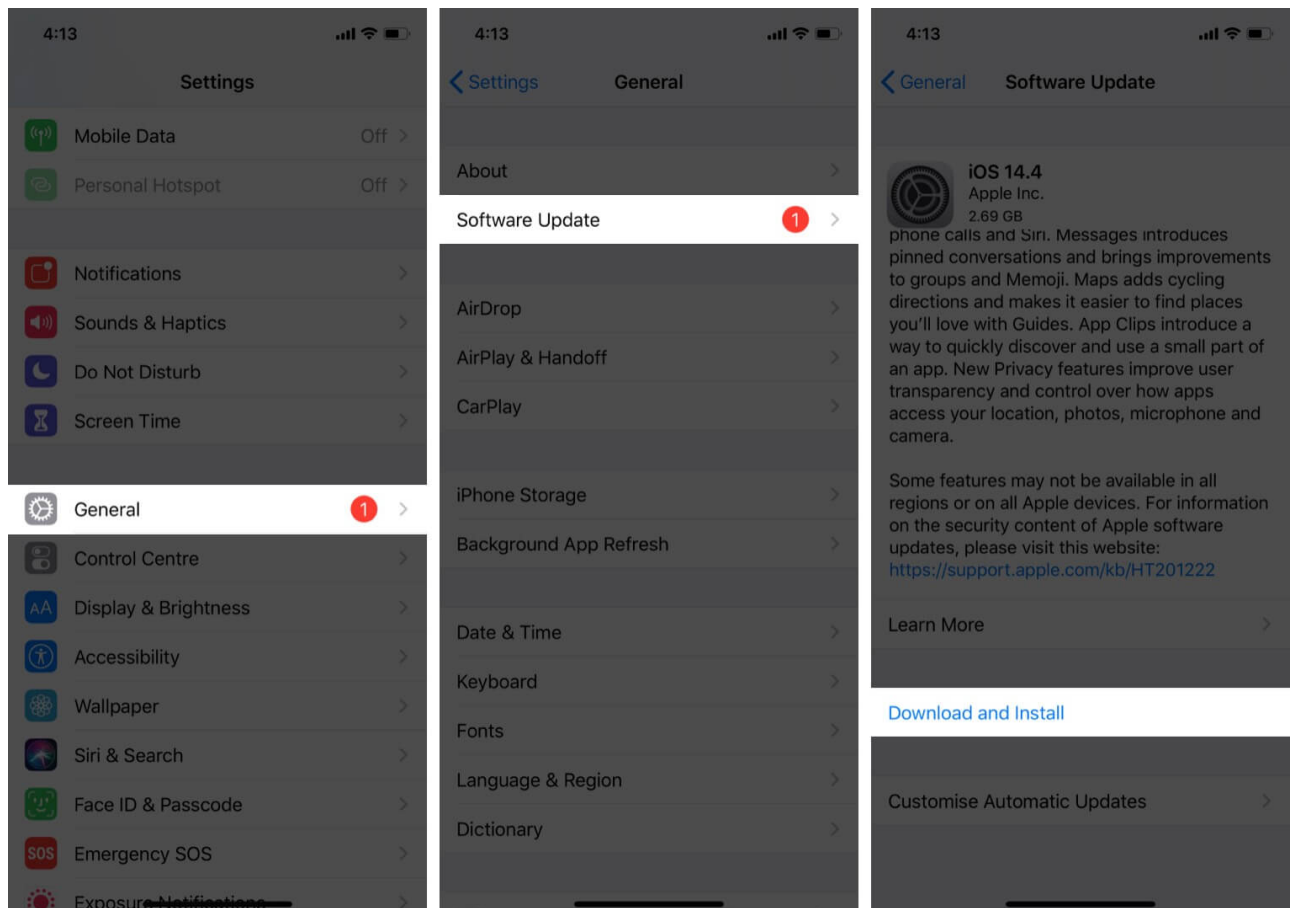

### 3. Update latest OS on both Apple Watch and iPhone

Are your iPhone and Apple Watch updated to the latest version? If not, it's worth upgrading to the newest OS. The outdated version of iOS or watchOS might be the culprit, as it has been so many times in the past.

#### Update iOS on your iPhone

Be sure your smartphone has around 50% battery life or greater and is connected to Wi-Fi.

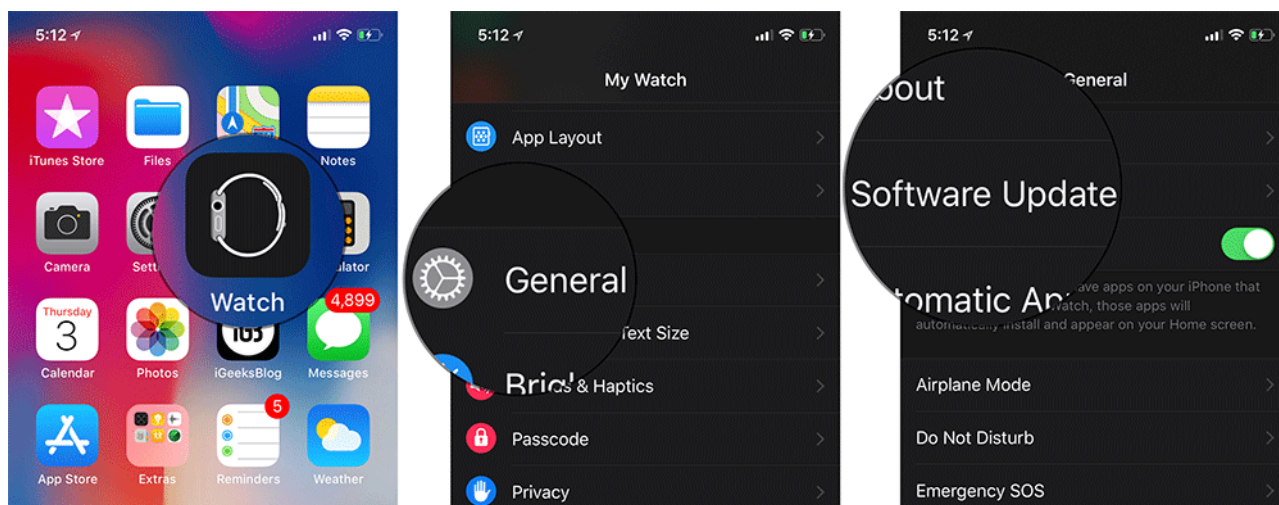

1. Launch **Settings** on your iOS device.
2. Now, tap **General** → **Software Update**.
3. If there's an update waiting for you, download and install it as usual.

## Update watchOS on your Apple Watch

Again, make sure that your watchOS device is connected to Wi-Fi. The watch should also have at least 50% battery.

1. Make sure to keep your watch on its charger until the update successfully completes.
2. On your iPhone, launch **Watch**.
3. Ensure that the **My Watch** tab is selected if it's not already.
4. Now, tap **General** → **Software Update**. Download the update if one is available.

**Note:** Enter your iPhone or Apple Watch passcode if prompted.

If your software is already up to date, we have one more solution for you.

## 4. Unpair Apple Watch from iPhone and re-pair it

This is a nuclear solution that can rid your watch of even the most stubborn of issues. watchOS lets you unpair your wearable device from your iPhone and re-pair it with ease. Don't worry about your data—it's automatically backed up, and you'll be able to restore your smartwatch from the previous backup without a hassle.
