

Even if you are a seasoned iPhone user, you might not know that your iPhone's keyboard isn't just a basic typing tool; it's packed with features that can elevate productivity and communication. From swipe to undo and redo to proofreading your text for any typos, your iPhone's keyboard can do it all in a blink.

In this post, I've compiled the most extensive list of the coolest keyboard tips and tricks for iPhone and iPad that can make your textual conversations more effective.

iPhone keyboard tips and tricks

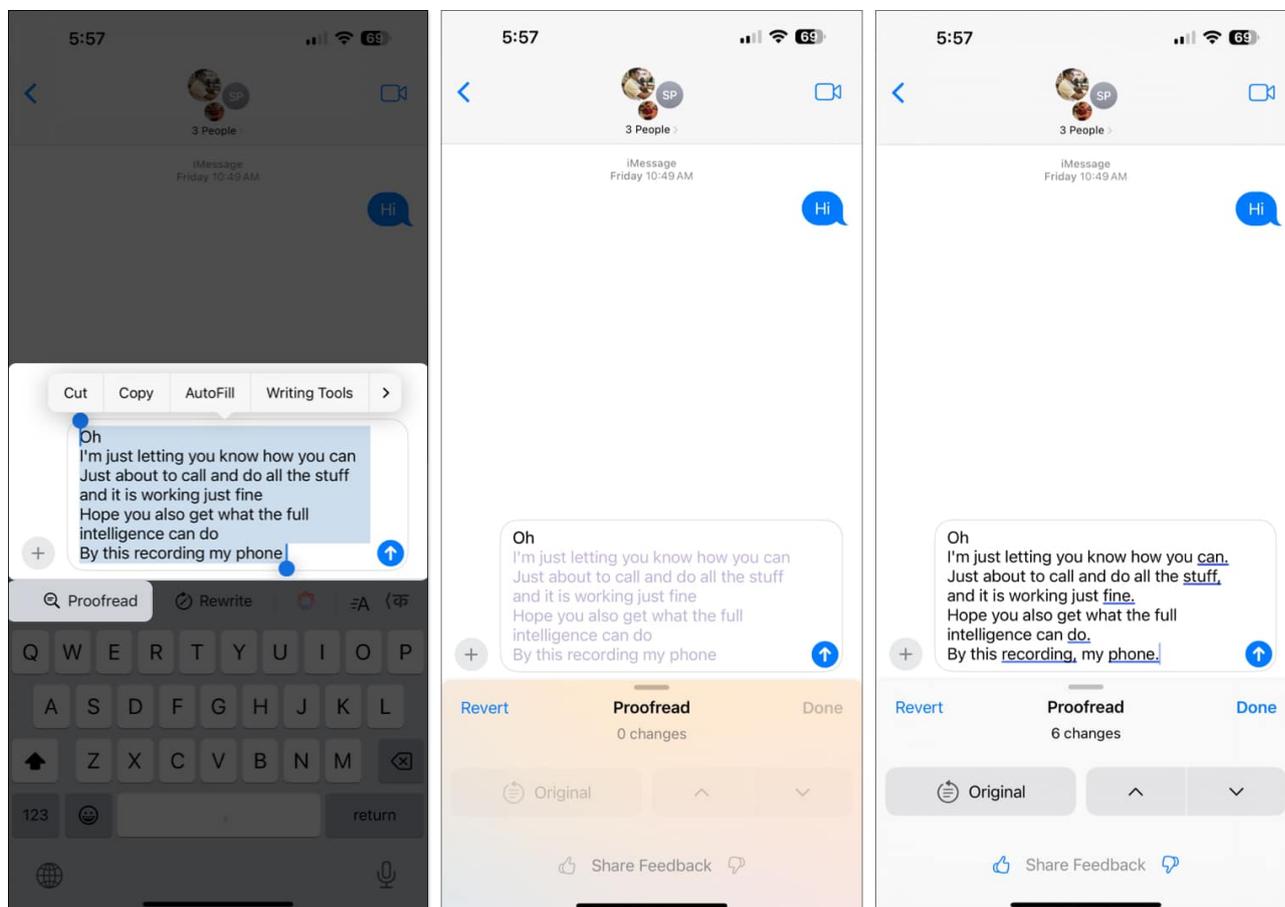

1. [Proofread, rewrite text](#)
2. [Use multilingual keyboard](#)
3. [Drag and drop the cursor to move or zoom](#)
4. [Quickly select words or entire paragraphs](#)
5. [Swipe to type with QuickPath](#)
6. [Transform your keyboard into a Trackpad on iPhone](#)
7. [Pinch and release gesture to copy, cut, and paste](#)
8. [Swipe to undo and redo](#)
9. [Shake to undo on your iPhone](#)
10. [Copy and paste between devices](#)

11. [Enable one-handed keyboard on iPhone](#)
12. [Use voice dictation](#)
13. [Quickly enter a period](#)
14. [Type to search for an emoji](#)
15. [Use Text Replacement on iPhone or iPad](#)
16. [Access Keyboard Settings in a jiffy](#)
17. [Easily capitalize words](#)
18. [Access numbers and punctuation without switching keyboards](#)
19. [Use the nifty key flick feature \(iPad keyboard trick\)](#)
20. [Get more character options](#)
21. [Instantly lookup for words on your iPhone](#)
22. [Try Landscape mode on iPhone or iPad](#)
23. [Pinch, Shrink, or Move Keyboard \(iPad keyboard trick\)](#)
24. [Hide Keyboard on your iPhone](#)
25. [Install custom fonts](#)
26. [Disable the popup character preview](#)
27. [Shortcuts on iPad keyboard](#)
28. [Enter the domain address faster](#)

1. Proofread, rewrite text

[Apple Intelligence writing tools](#) have your back if you are often susceptible to typos in your writing. You can proofread your text from your keyboard and ask Apple Intelligence to rewrite it in a different tone. However, you can use the writing tools if you own an iPhone 15 Pro or later. With that said, here's how you can use Apple Intelligence writing tools right from your iPhone keyboard:

1. Select the text you want to proofread or rewrite.
2. Once done, tap the **Writing Tools** in the pop-up menu and choose **Proofread**. Alternatively, you'll see the Proofread option above the keyboard.

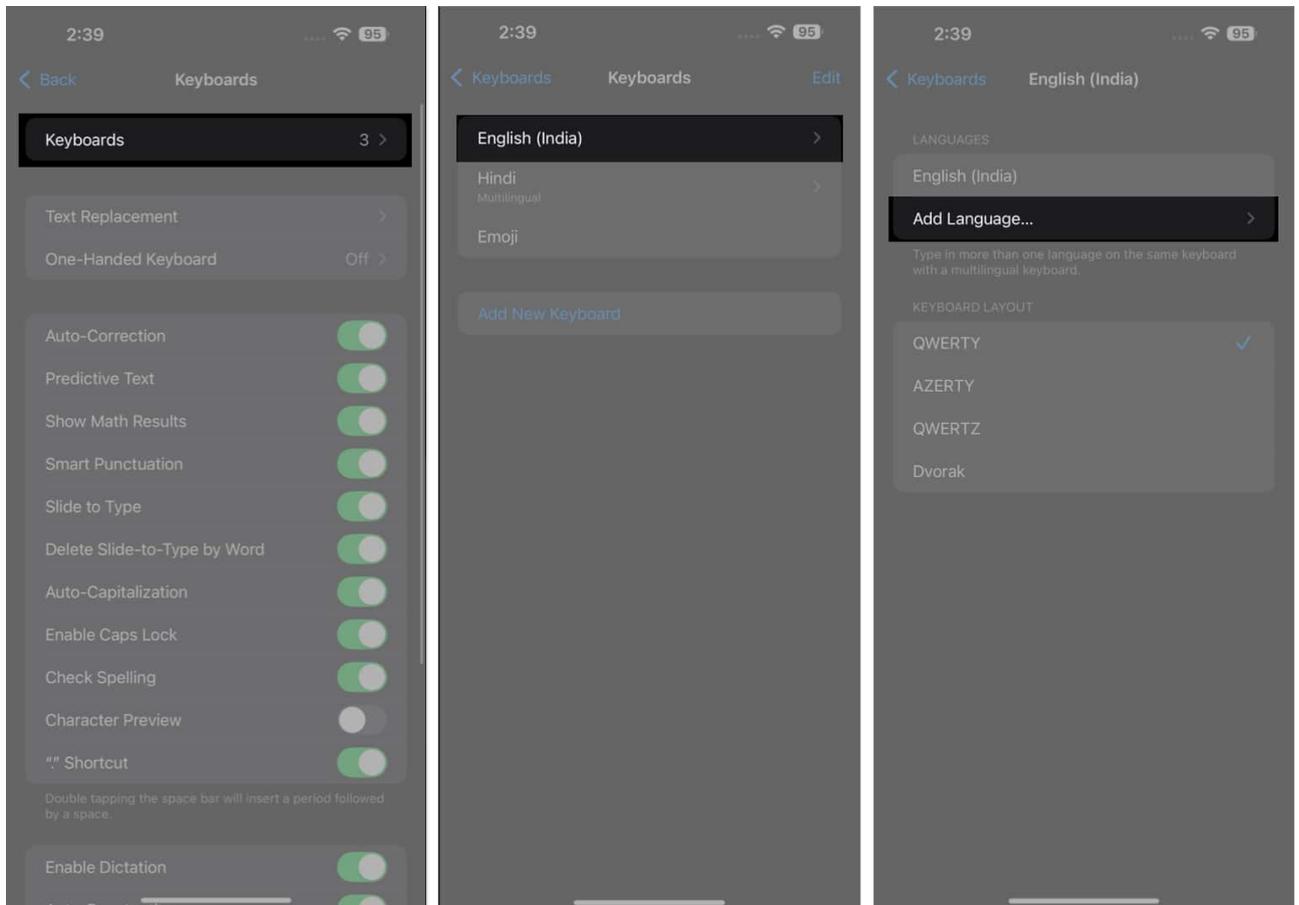

Apple Intelligence will proofread the text for you and edit it if there are any mistakes. Similarly, the Rewrite option will allow Apple Intelligence to rewrite the text. You can stick with the rewritten text or tap the revert button to revert to your original text.

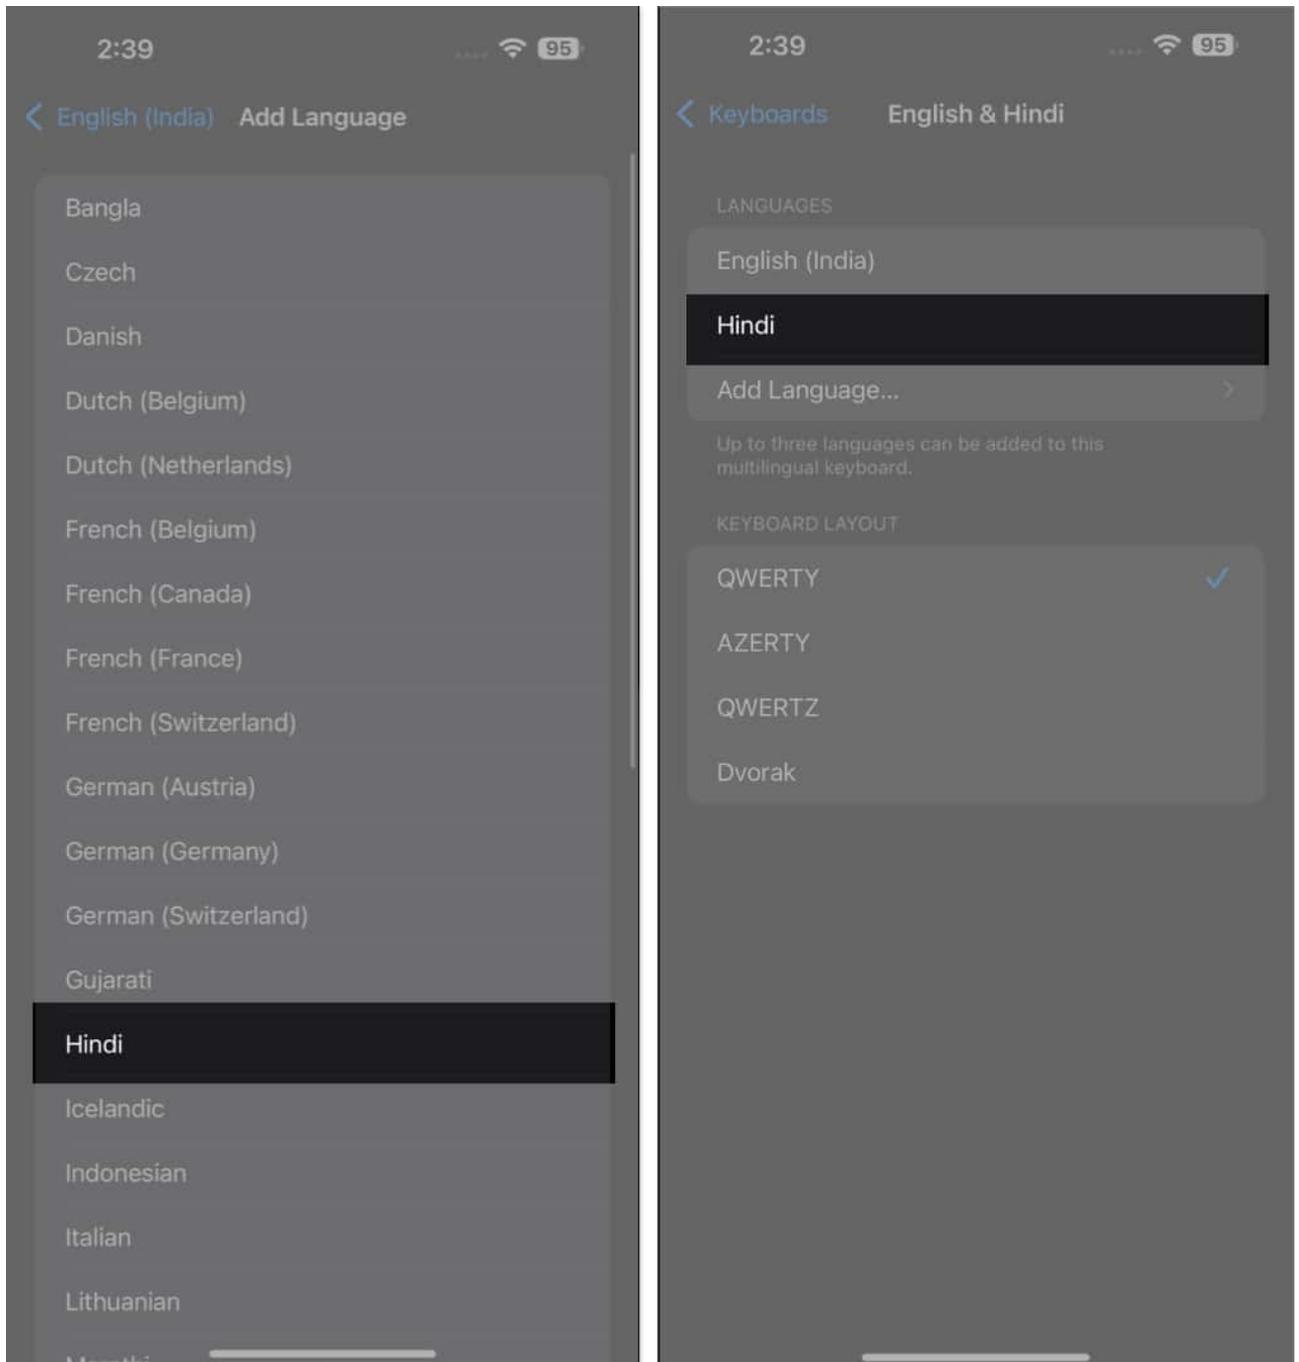

2. Use a multilingual keyboard

Want to add words in more than one language in a single sentence? Well, with [iOS 18](#), Apple added multilingual keyboard support for iPhones. You can add up to three languages to your keyboard and type in multiple languages simultaneously. Here's how you can set up a multilingual keyboard:

1. Open **Settings** on your iPhone and tap **General**.
2. Here, tap on **Keyboard**.
3. Next, tap on **Keyboards**, then tap on the language keyboard → **Add Language**.

4. Now, select your preferred language.

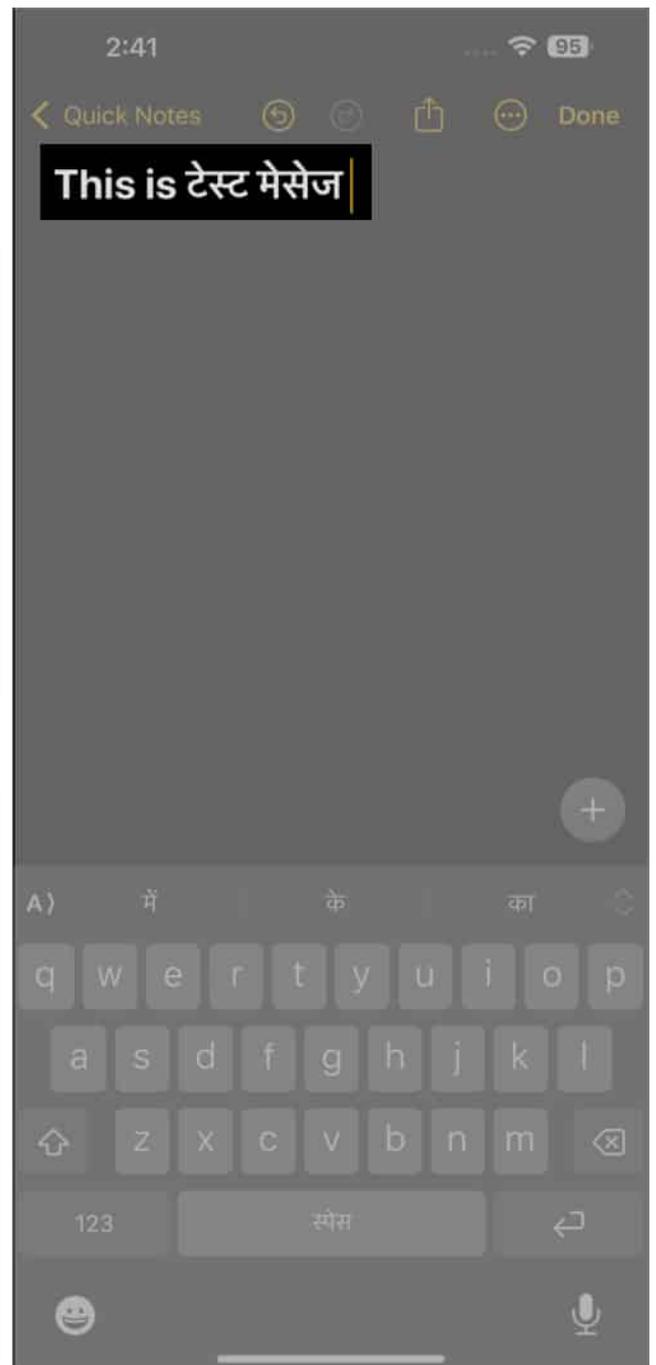

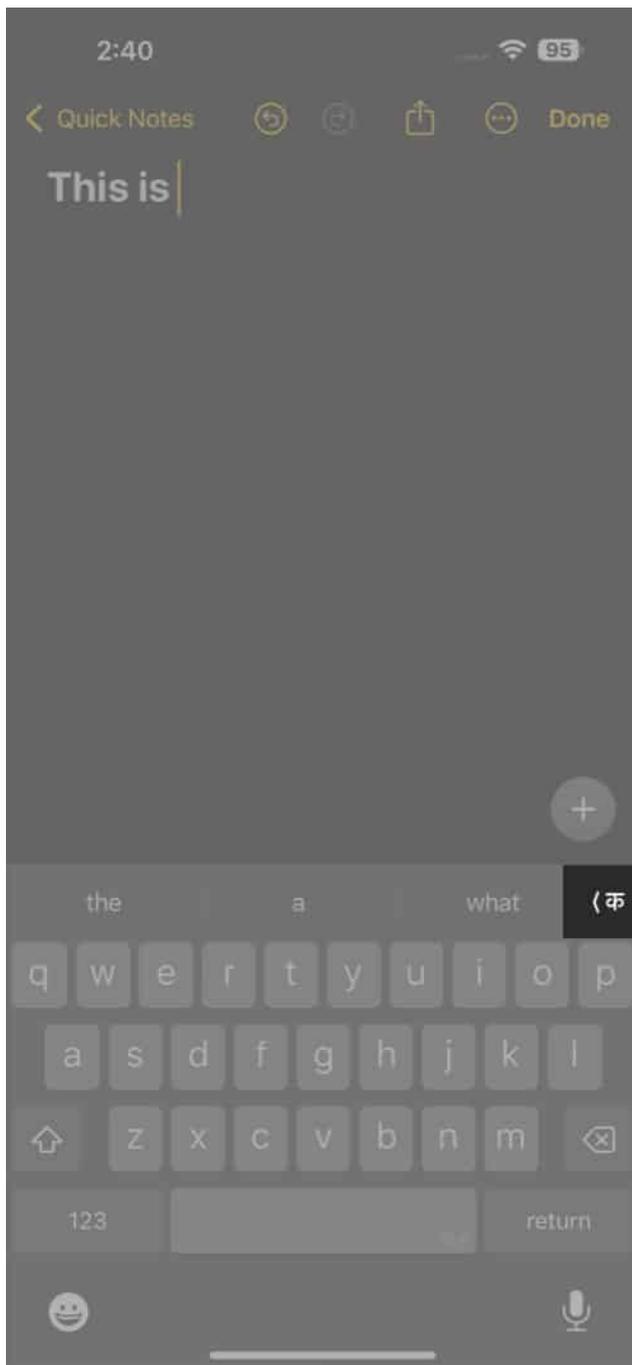

Now that you have added multiple languages to your iPhone keyboard, you can now type in multiple languages. For example:

1. Open the Notes app and start typing.
2. Tap the **other language letter** at the extreme right of the predictive text section to

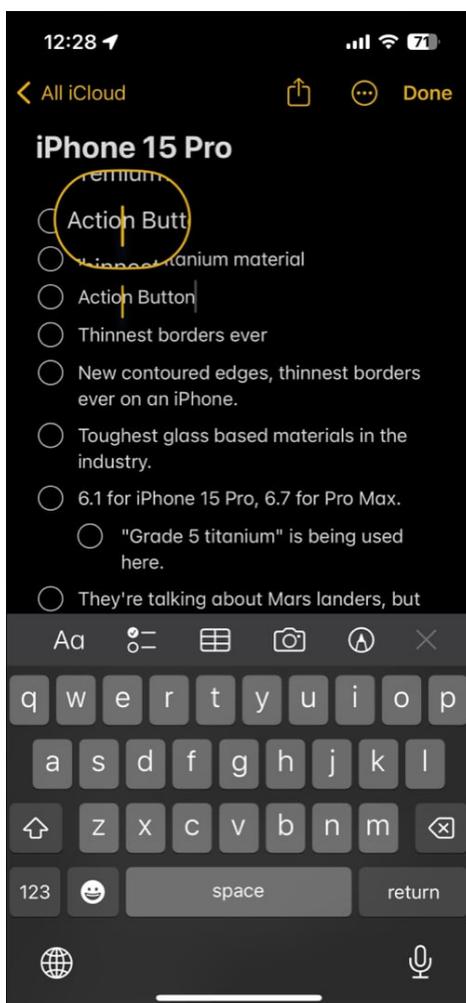

switch languages while typing.

3. Now, continue typing; each word you type will automatically convert to the other selected language.

3. Drag and drop the cursor to move or zoom

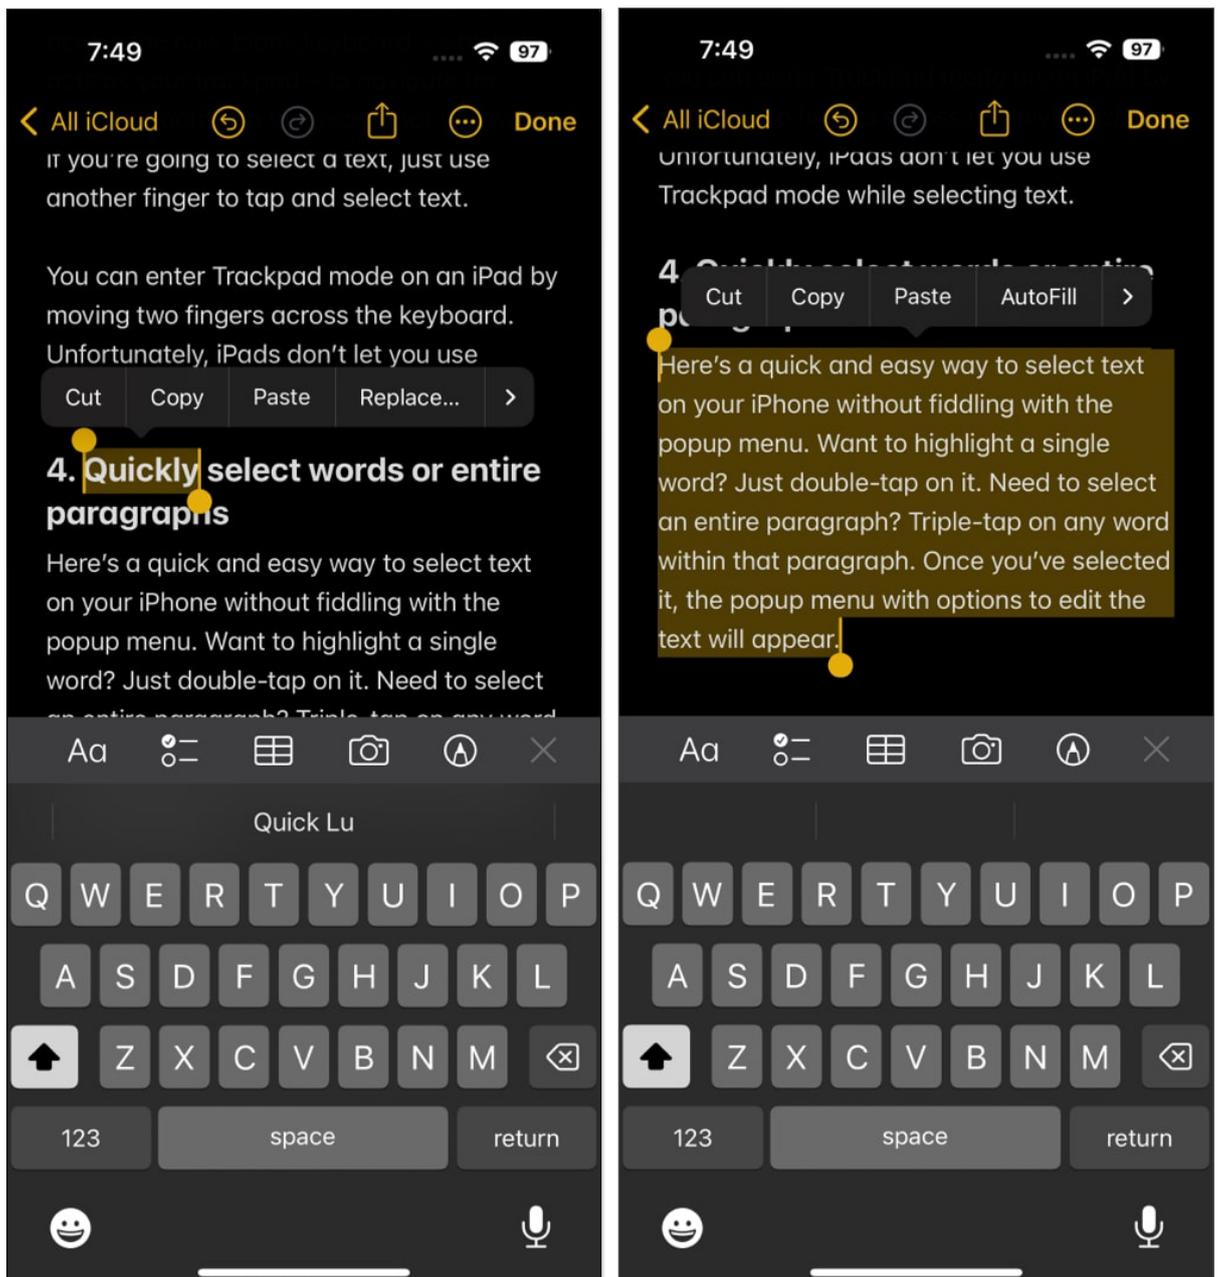

- Do you need to move the cursor to a specific spot on your screen? It's super easy. Just **tap anywhere** on the screen.
- You can also **tap and drag to use the magnifying glass** feature that zooms in on the text where the cursor is. This nifty drag-and-drop method makes editing text or navigating through your content a breeze.

4. Quickly select words or entire paragraphs

Here's a quick and easy way to select text on your iPhone without fiddling with the popup menu.

- **To highlight a single word:** Just double-tap on it.
- **To select an entire paragraph:** Triple-tap on any word within that paragraph.
 - Once you've selected it, the popup menu with options to edit the text will appear.

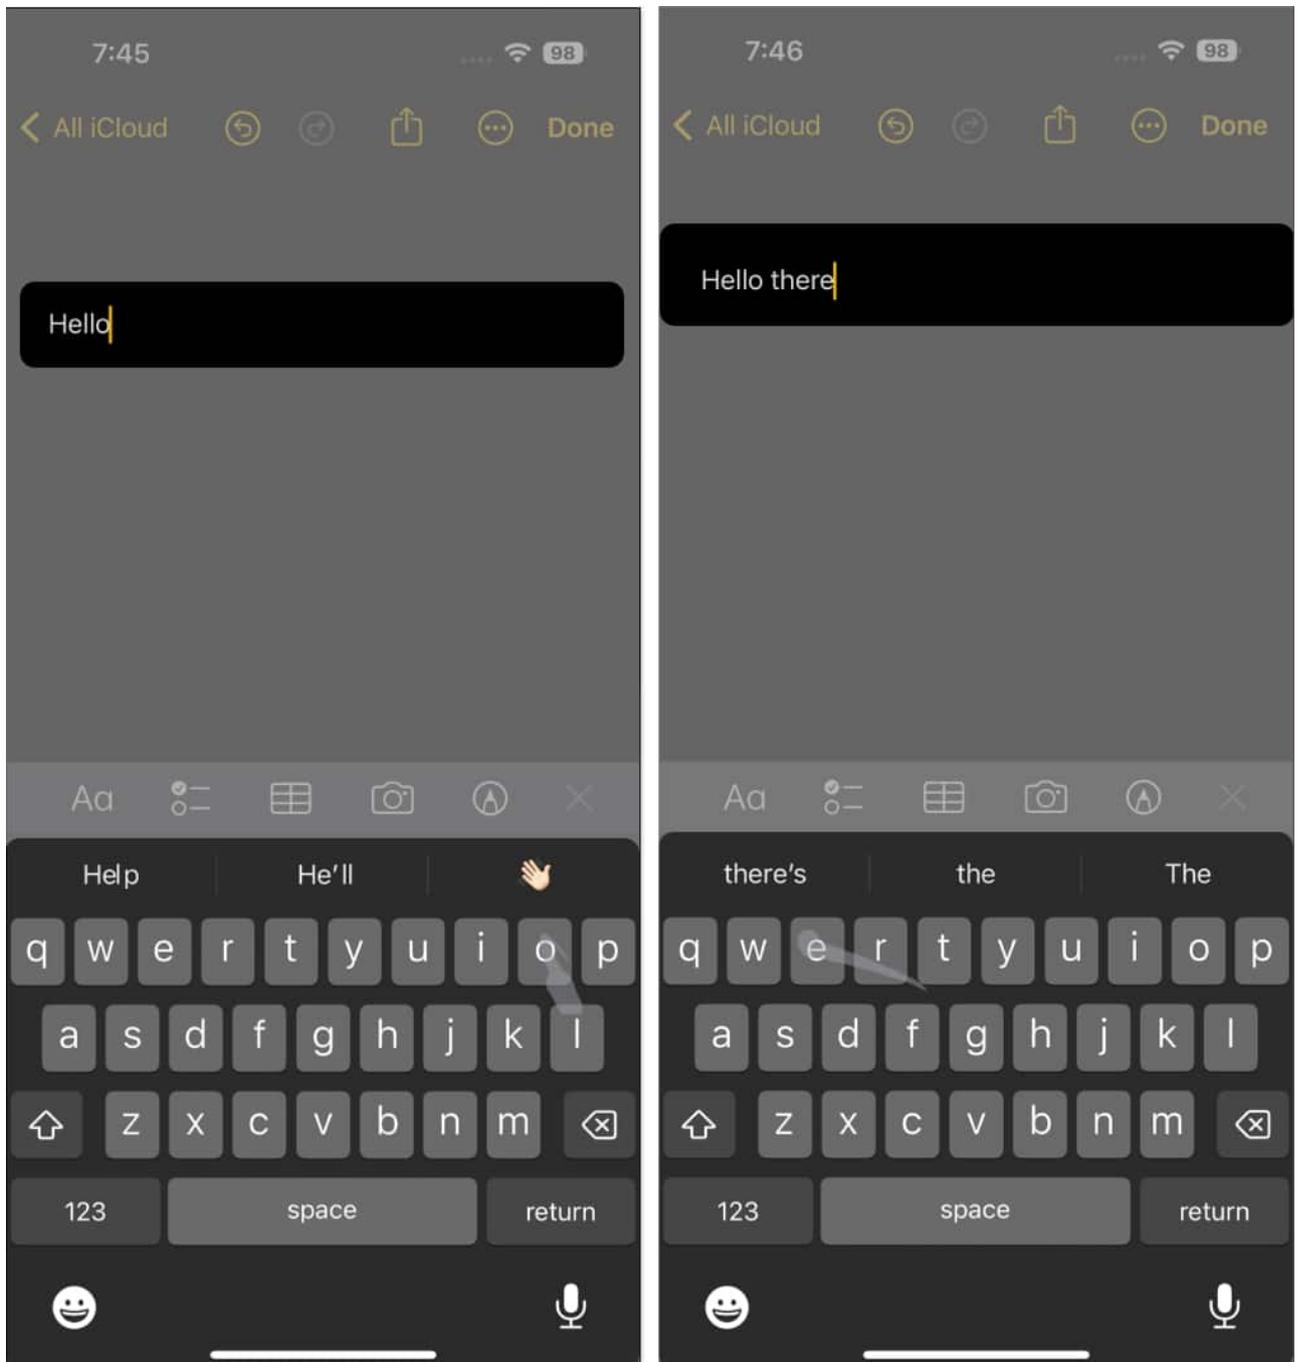

These were some really simple iPhone keyboard tricks. Now, let's move on to some [iOS 18 tips and tricks](#) that require you to do a bit more.

5. Swipe to type with QuickPath

Apple keyboards have a QuickPath feature that lets you swipe from letter to letter instead of tapping them individually.

1. To use it, **swipe from one letter to another** until you've spelled the entire word.
2. Then, **release your finger** and see the word on the screen.

3. Sometimes, QuickPath gets your swipes wrong. When this happens, tap the Delete button and give it another try.

Sure, QuickPath might initially feel a bit unfamiliar, but stick with it. Once you've got the hang of it, you'll [find your typing is faster and more fluid](#).

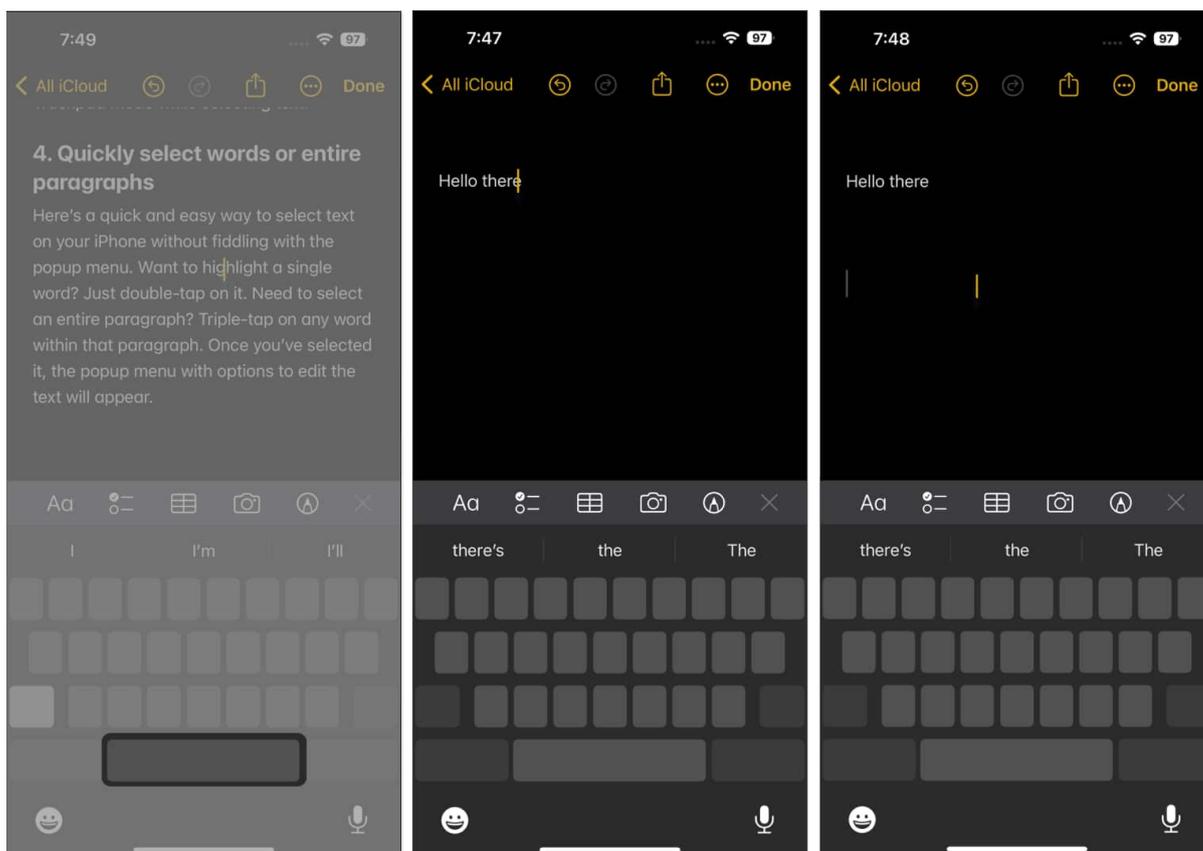

To master it faster, learn more about [how to use the QuickPath Swipe keyboard on your iPhone](#).

6. Transform your keyboard into a Trackpad on iPhone

Besides the QuickPath feature, another cool iPhone keyboard trick is transforming your keyboard into a trackpad. This is especially useful when dealing with a large chunk of text, and you need pinpoint precision for placing your cursor.

Here's how to do it:

1. Just **tap and hold the spacebar** until the letters on the keyboard vanish.
2. **Keep your finger down** → Then **slide it across** the now-blank keyboard - which acts as your trackpad - to navigate the cursor smoothly to the exact spot you want.
 - If you're going to select a text, just **use another finger to tap and select text**.

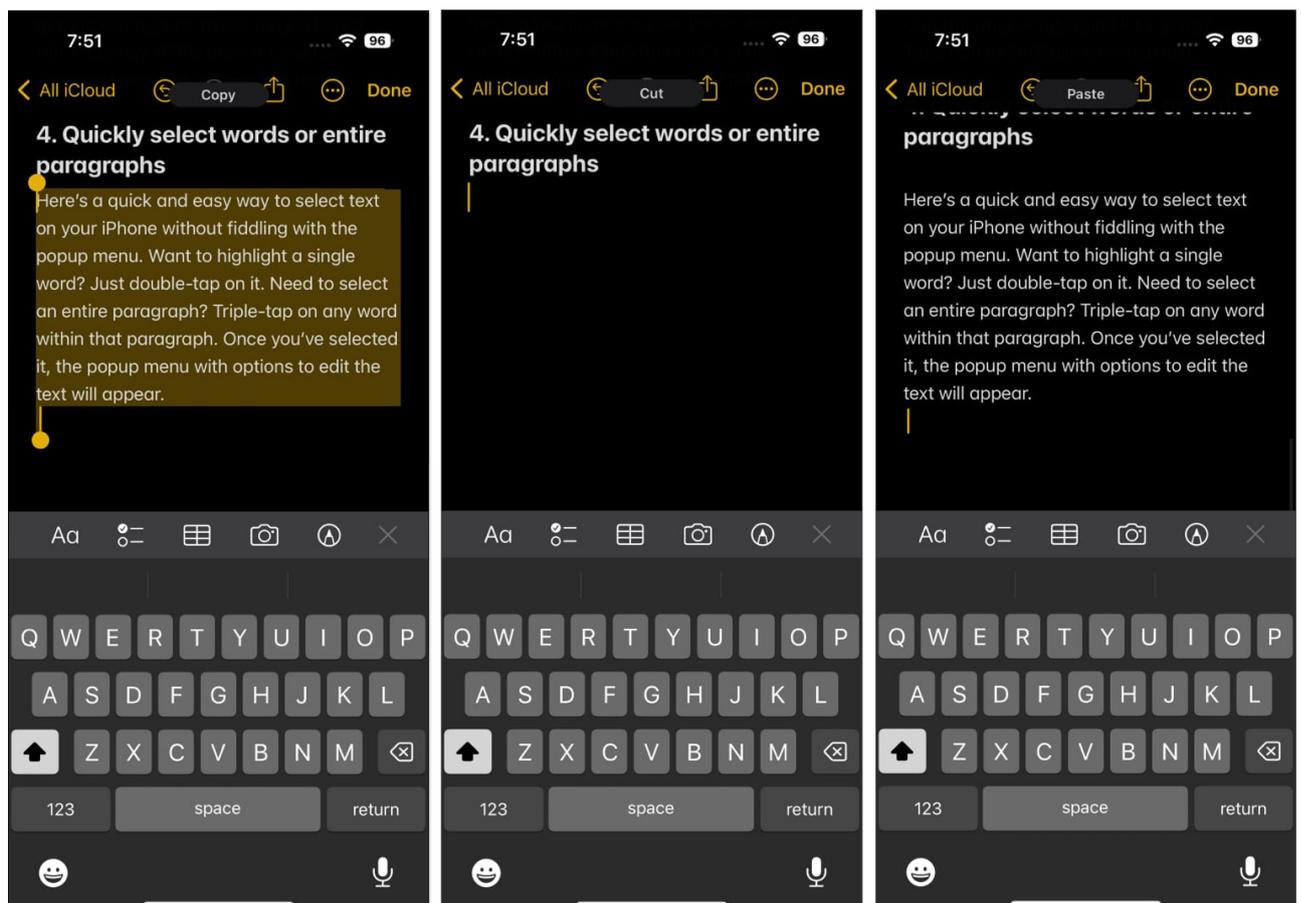

You can enter Trackpad mode on an iPad by moving two fingers across the keyboard.

Unfortunately, iPads don't let you use Trackpad mode while selecting text.

7. Pinch and release gesture to copy, cut, and paste

Another interesting iPhone keyboard trick is the option to use the three-finger pinch gesture to copy, cut, and paste selected text.

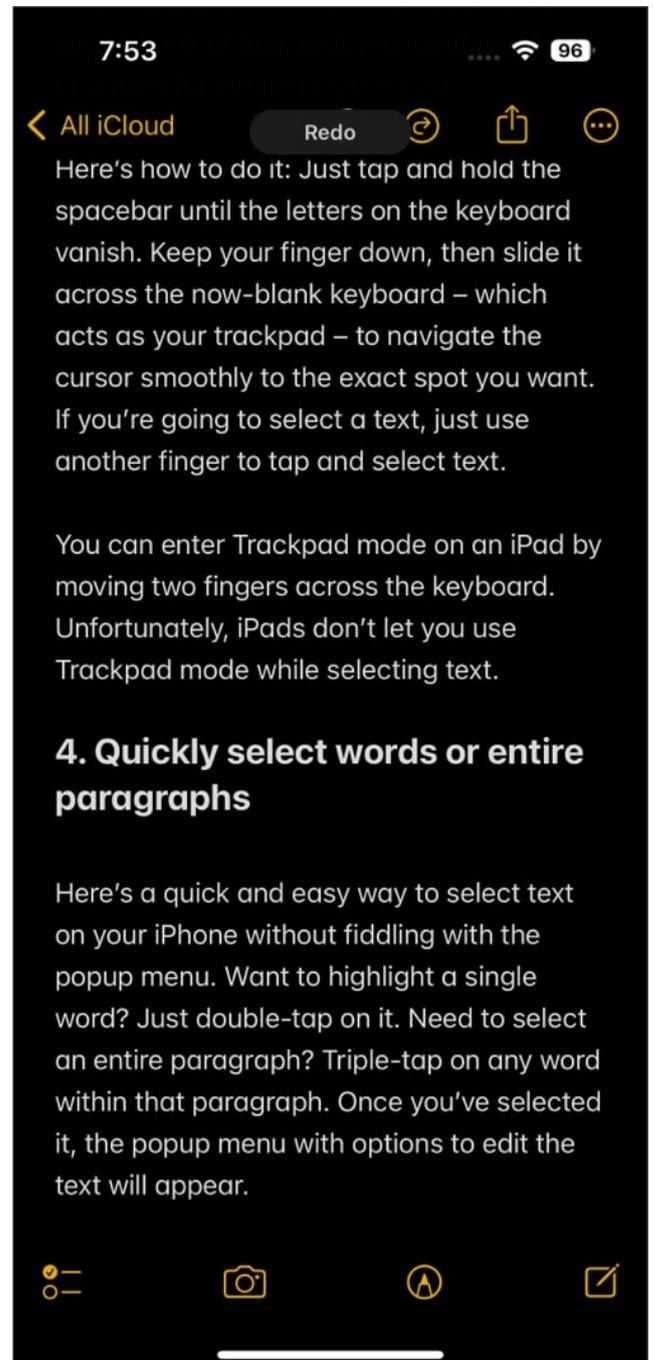

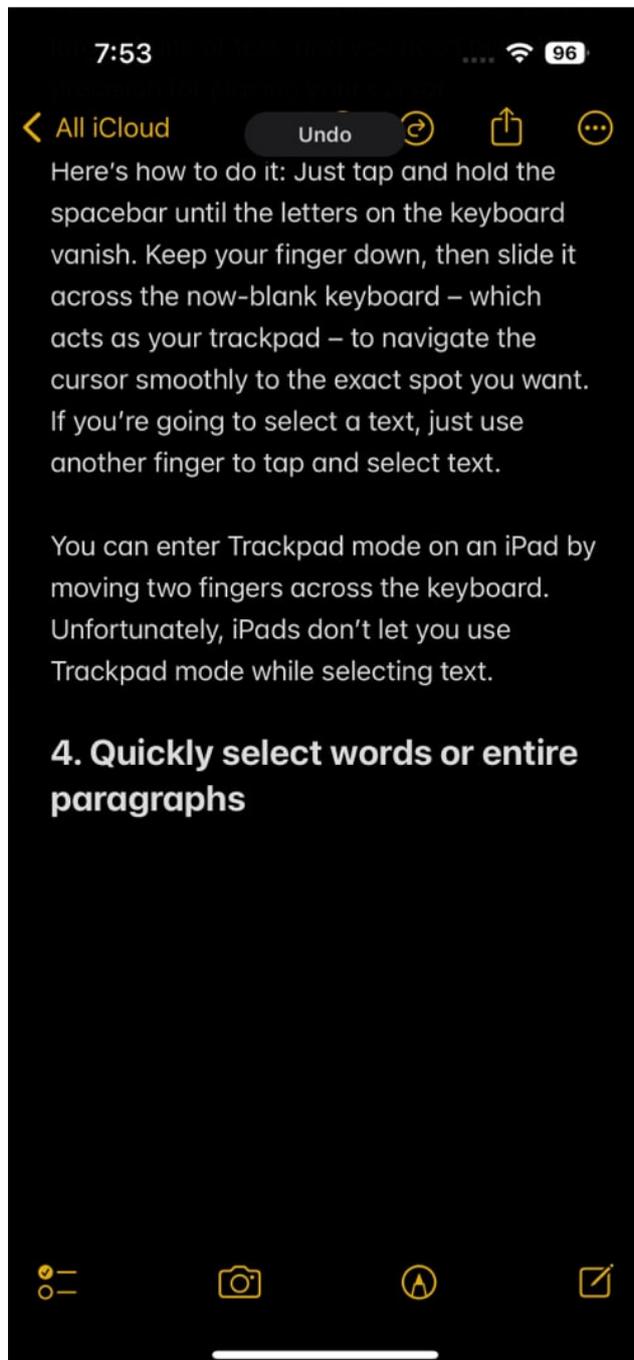

- After selecting the text you want to work with, use a **pinching gesture with three fingers** to copy it.
- Want to cut it instead? Just repeat that same **three-finger pinch-in** → When you're ready to paste the text, move the cursor to the desired spot and **perform a three-finger pinch-out gesture**.

8. Swipe to undo and redo

There are several ways to [undo and redo typing](#) on the iPhone and iPad, but one of the easiest is through a gesture.

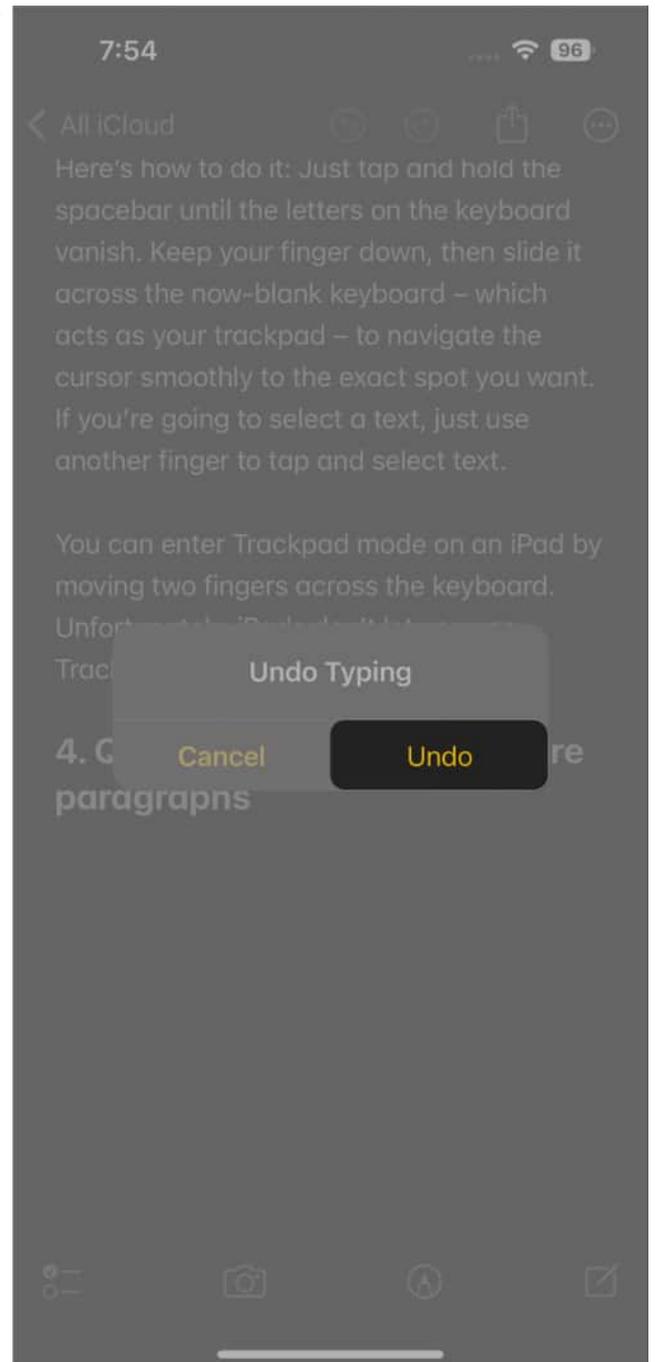

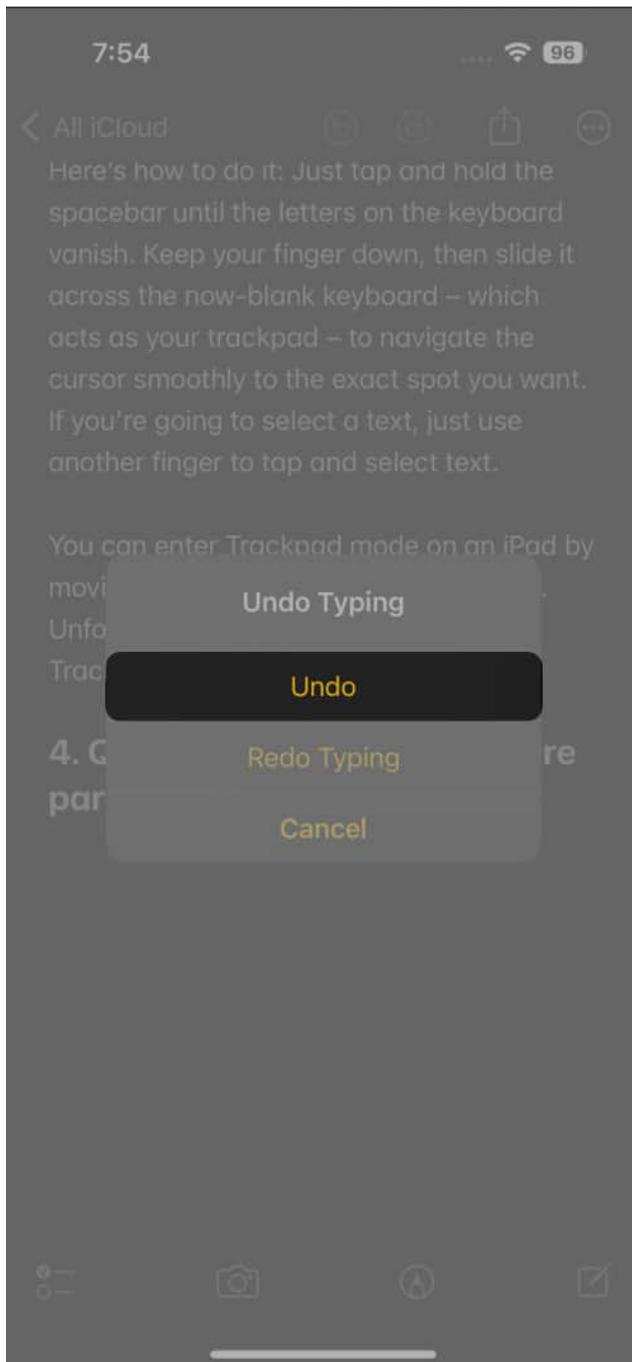

- If you want to undo an action, say a mistyped word, or mistakenly cut a text, **use three fingers and swipe from right to left** to undo it. You can do this multiple times.
- To redo the action, use the same gesture to **swipe from left to right**.

9. Shake to undo on your iPhone

If you find the three-finger gesture challenging to do on a small iPhone screen, there's another way to undo an action on your iPhone.

1. Just give your iPhone a **quick shake**.
2. A popup will ask if you want to **Undo** your most recent action.
3. Select **Undo**.

10. Copy and paste between devices

If you have multiple Apple devices and are logged on using the same Apple ID on each device, you can [use the universal clipboard feature](#) to copy text from one device and paste it to another.

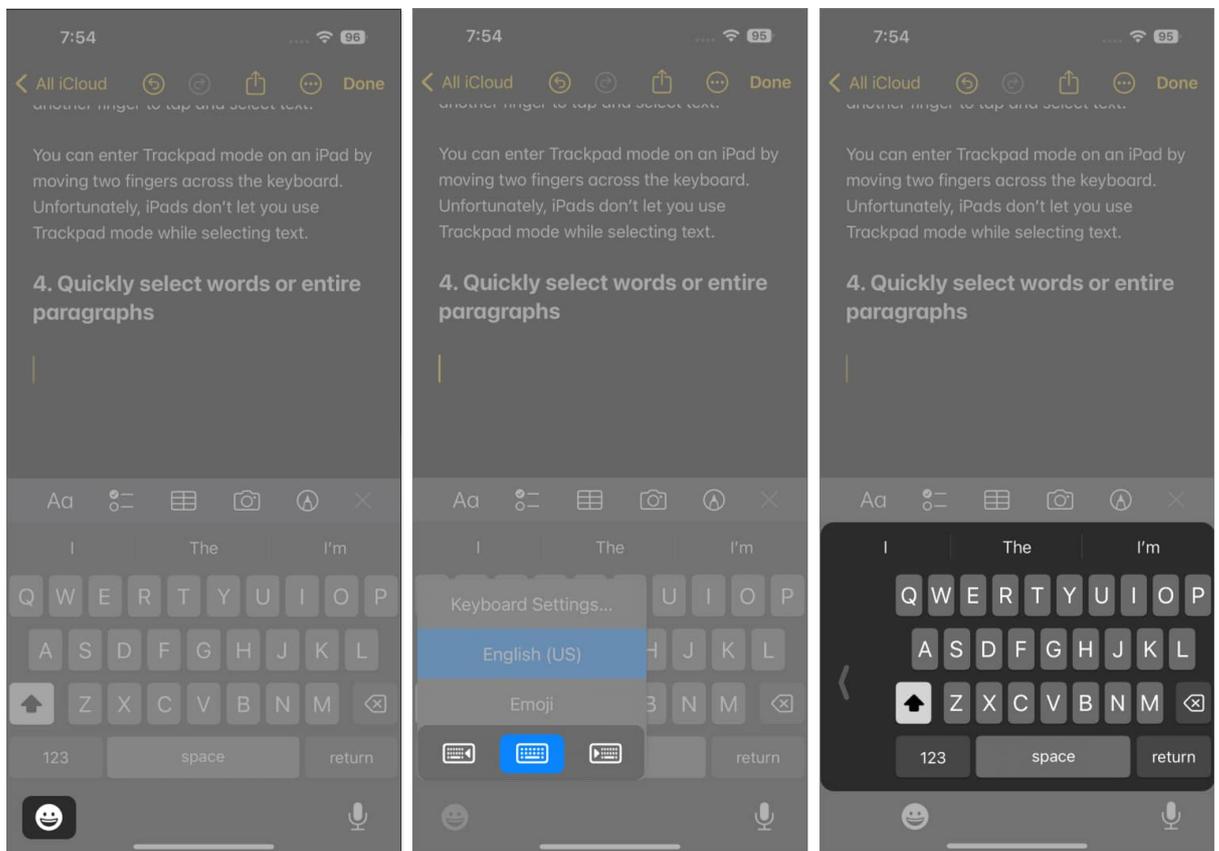

Please make sure that both devices have their Bluetooth and Wi-Fi turned on and that you have [enabled Handoff on both devices](#).

11. Enable one-handed keyboard on iPhone

Most of the time, we only use one hand when using our iPhones. In that case, typing on a keyboard can be difficult, especially when trying to tap keys at the far end of the phone.

Fortunately, you can use one-hand typing mode on your iPhone.

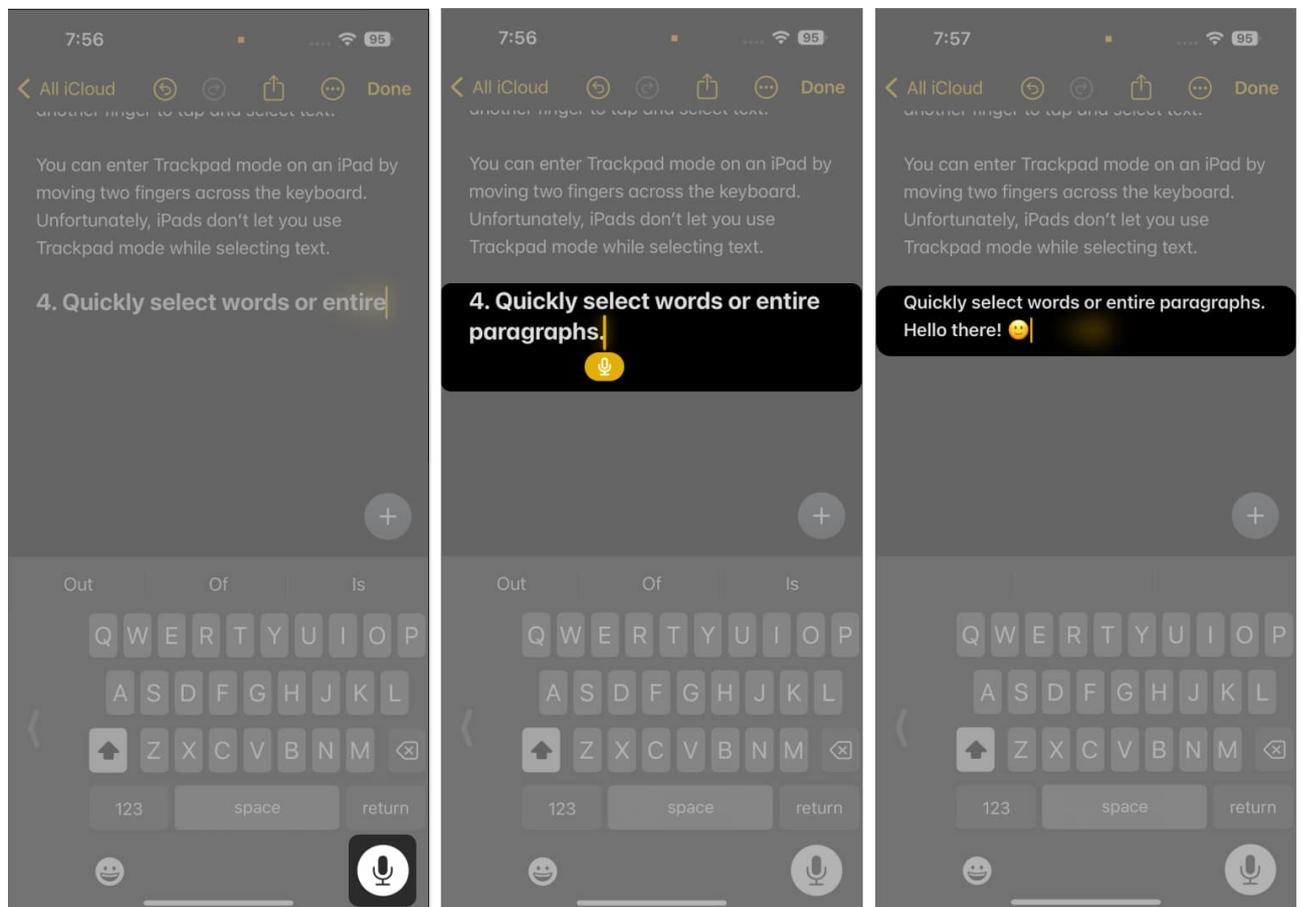

1. To do this, hold the **Globe** or **Emoji icon** on the lower left part of the keyboard.
This gives you quick access to the Keyboard Settings.
2. Select either the **left or right-handed keyboard** on either side of the full keyboard.
 - This shifts the keyboard to the left or right of the screen, allowing you to reach the entire keyboard with a single hand.

12. Use voice dictation

If typing out long text messages or documents feels like a chore, don't forget you can always dictate to your iPhone or iPad.

1. Simply tap the **mic icon**, usually found on the **lower-right side of the keyboard** screen, and start speaking your thoughts.
2. It's not just words; you can even dictate punctuation and emojis. For emojis, just say the name followed by "emoji," like "heart emoji" or "smile emoji."

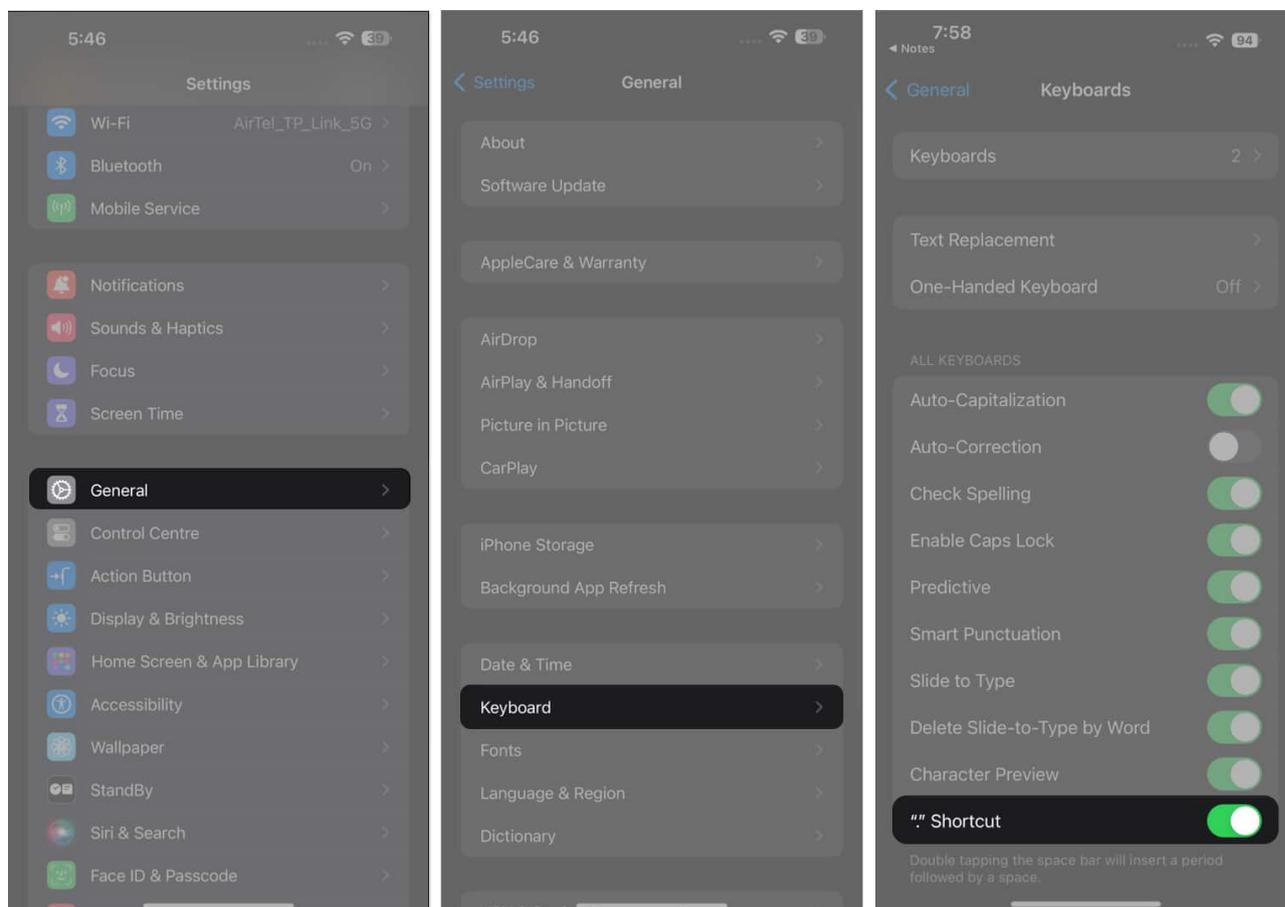

Voice dictation is incredibly handy, but being aware of privacy concerns is essential. In light of recent incidents involving privacy breaches, some users are cautious about using this feature. If privacy is a big concern for you, [consider removing the mic icon from your iPhone or iPad's keyboard](#) to help prevent accidental recordings.

13. Quickly enter a period

There's a neat little trick to save you from hunting for the period key in the punctuation keyboard on your iPhone or iPad. When the **"." keyboard shortcut** feature is enabled, you can quickly insert a period by just double-tapping the space bar.

1. To enable, go to **Settings** → **General** → **Keyboards**.
2. Toggle on **"." Shortcut**.

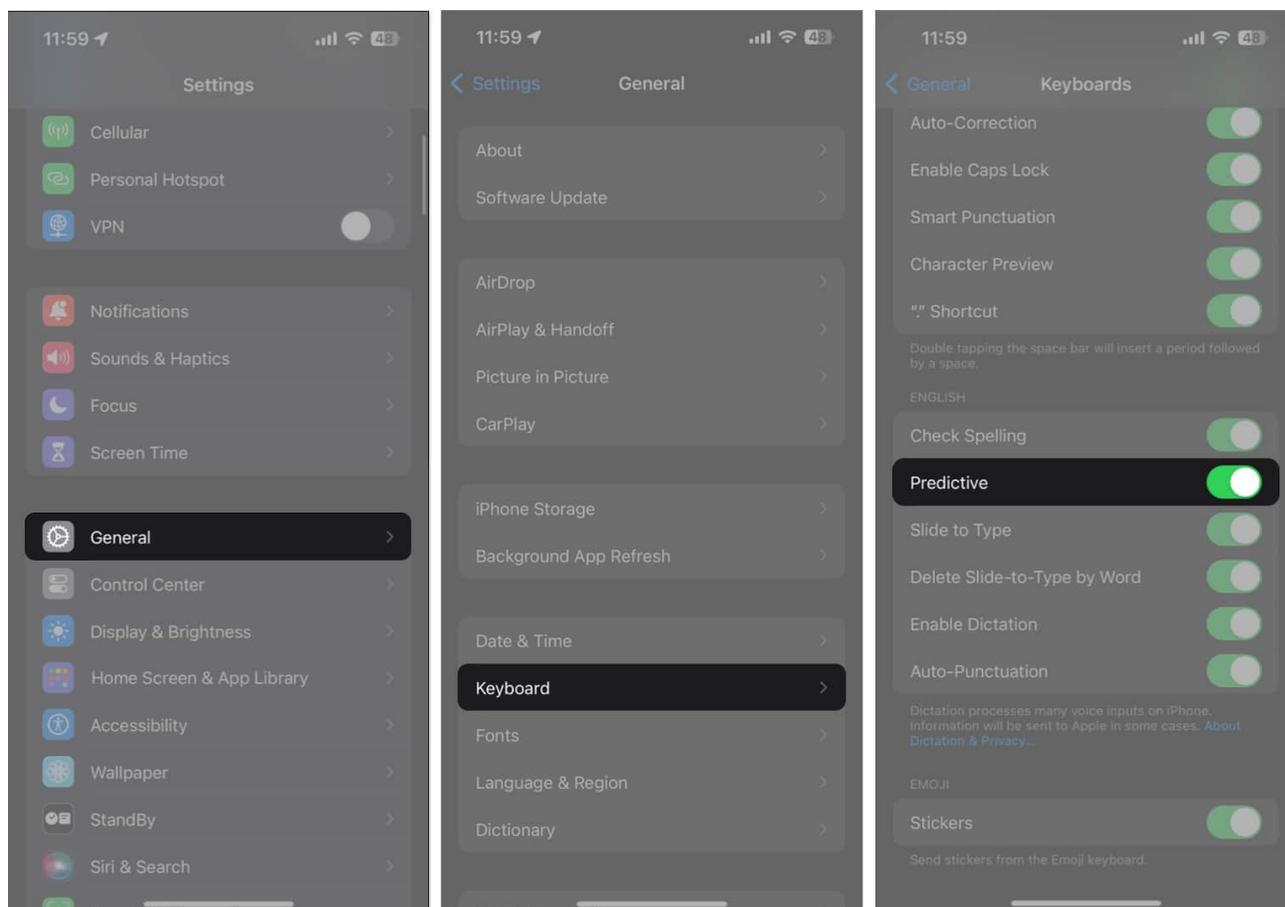

This simple tip can really keep your typing flow uninterrupted, making it perfect for when you're on a roll and don't want to pause to switch keyboards for punctuation.

14. Type to search for an emoji

Unlike on the Mac, you can't search for an emoji using text on the iPhone. Fortunately, you can do something similar using the iPhone keyboard's **Predictive** feature.

You only need to type a word and find your keyboard suggesting an appropriate emoji or emojis on the predictive field. To enable this:

1. Head to **Settings** → **General** → **Keyboard**.
2. Toggle on **Predictive**.

Note

If you want more screen space, you can disable the predictive feature by removing the predictive field resting on top of the keyboard. Just follow the same steps and toggle off Predictive.

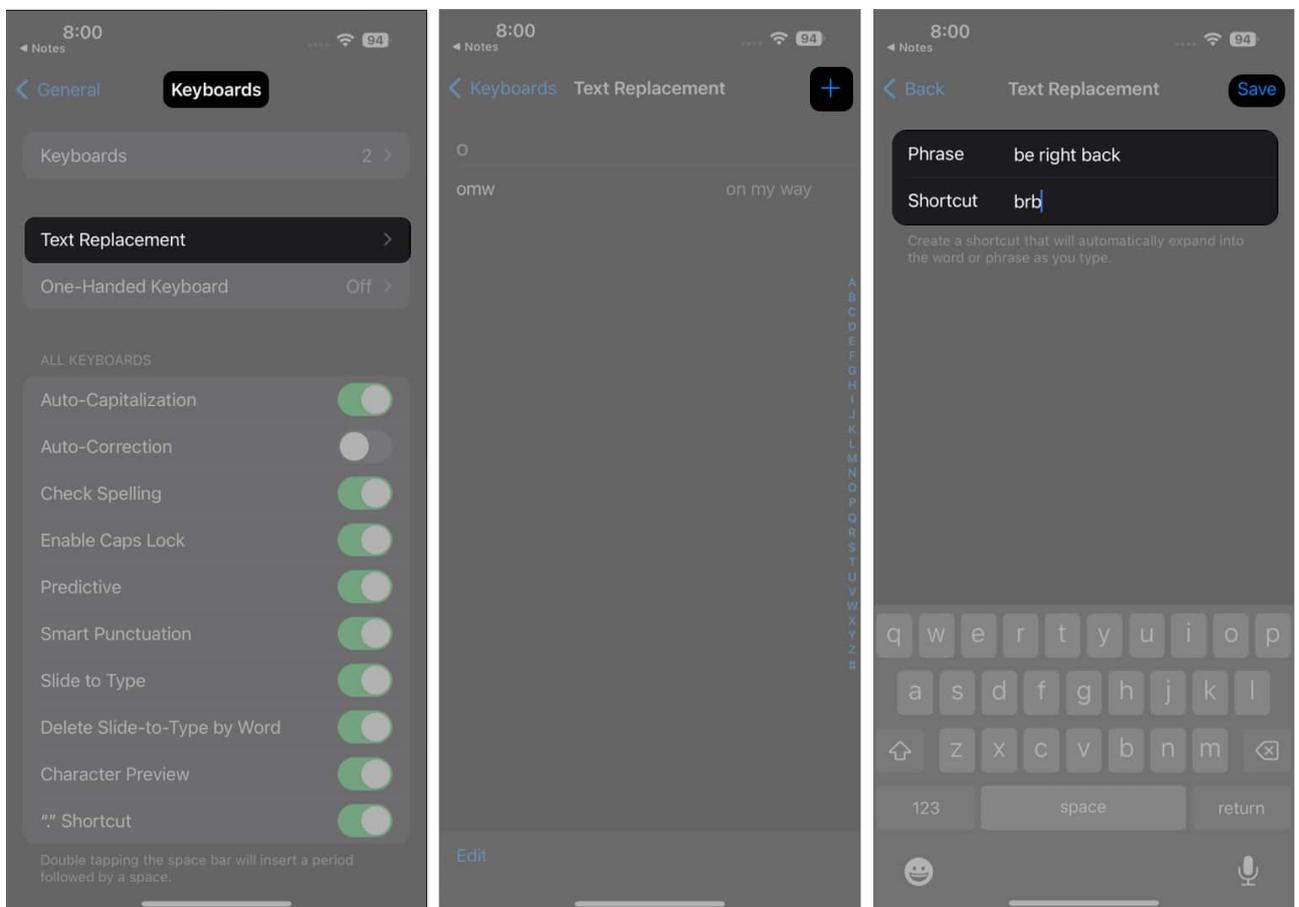

Note: If you want more screen space, you can disable the predictive feature by removing the predictive field resting on top of the keyboard. Just follow the same steps and toggle off Predictive.

15. Use Text Replacement on iPhone or iPad

Abbreviations like BRB and GTG are so commonly used; truthfully, they let you express yourself with minimal effort.

You can use **Text Replacement** to create shortcuts for your favorite words or phrases that you frequently type. To do this:

1. Go to **Settings** → **General** → **Keyboard**.
2. Select **Text Replacement**.
3. Tap the **Add (+)** icon.
4. Enter the word or the phrase you frequently use in the field beside **Phrase**.
5. Type the shortcut that will automatically expand into the phrase you saved in the field beside **Shortcut**.
 - This could be the phrase's abbreviation, such as **omw** for **on my way**.
6. Tap **Save**.

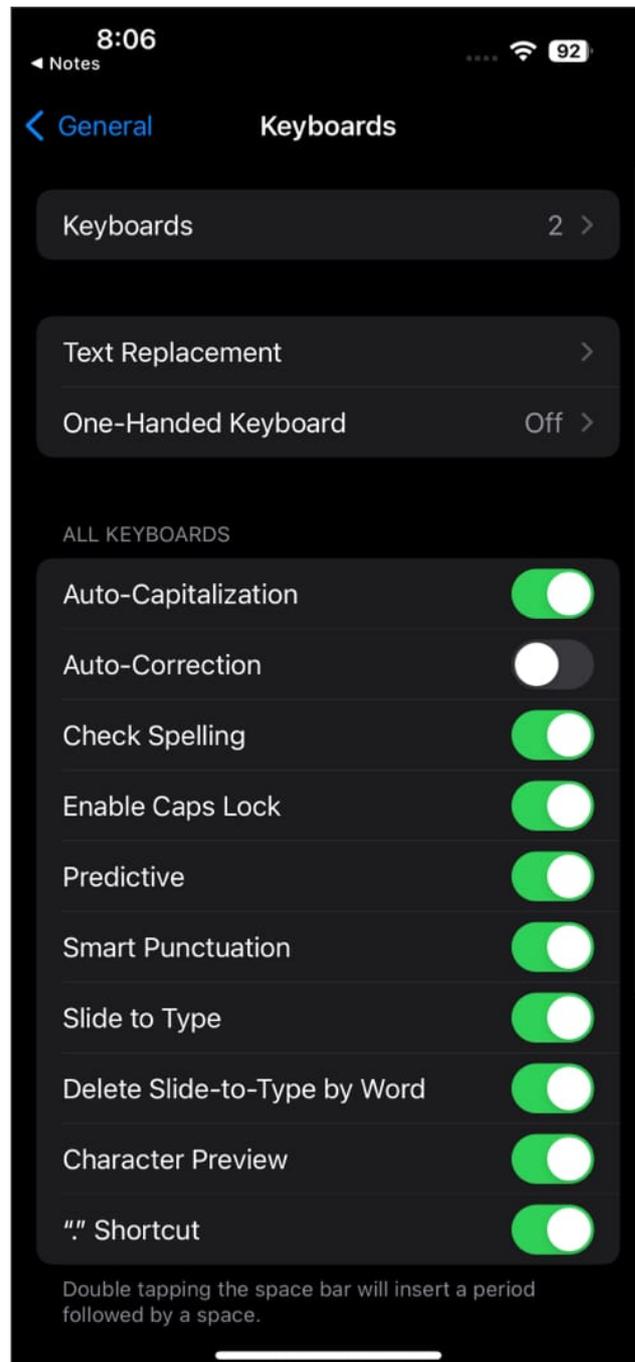

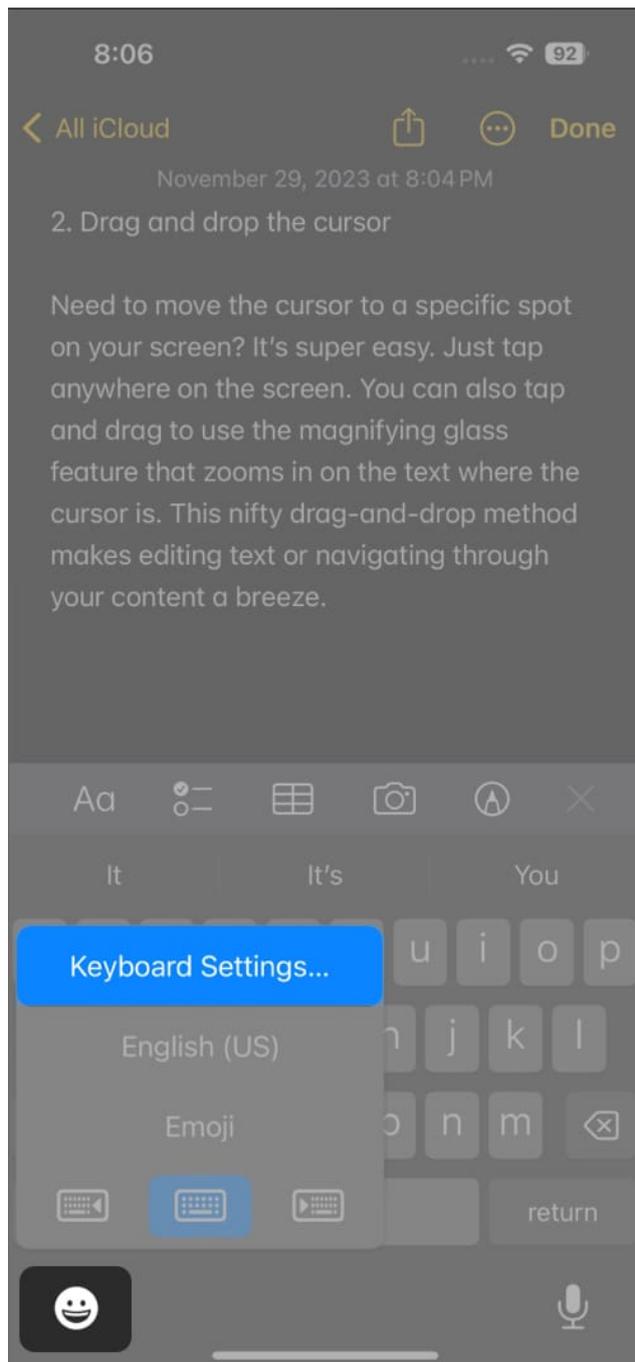

16. Access Keyboard Settings in a jiffy

While navigating to the keyboard settings isn't exactly hard, there are times when you want to make some quick adjustments to your keyboard. For example, you may find the predictive feature annoying or the autocorrect feature hindering you from typing your message.

Fortunately, accessing Keyboard Settings is easy and can be accessed right at your

keyboard.

- Just tap and hold the **Globe** or **Emoji icon** → select **Keyboard Settings**.

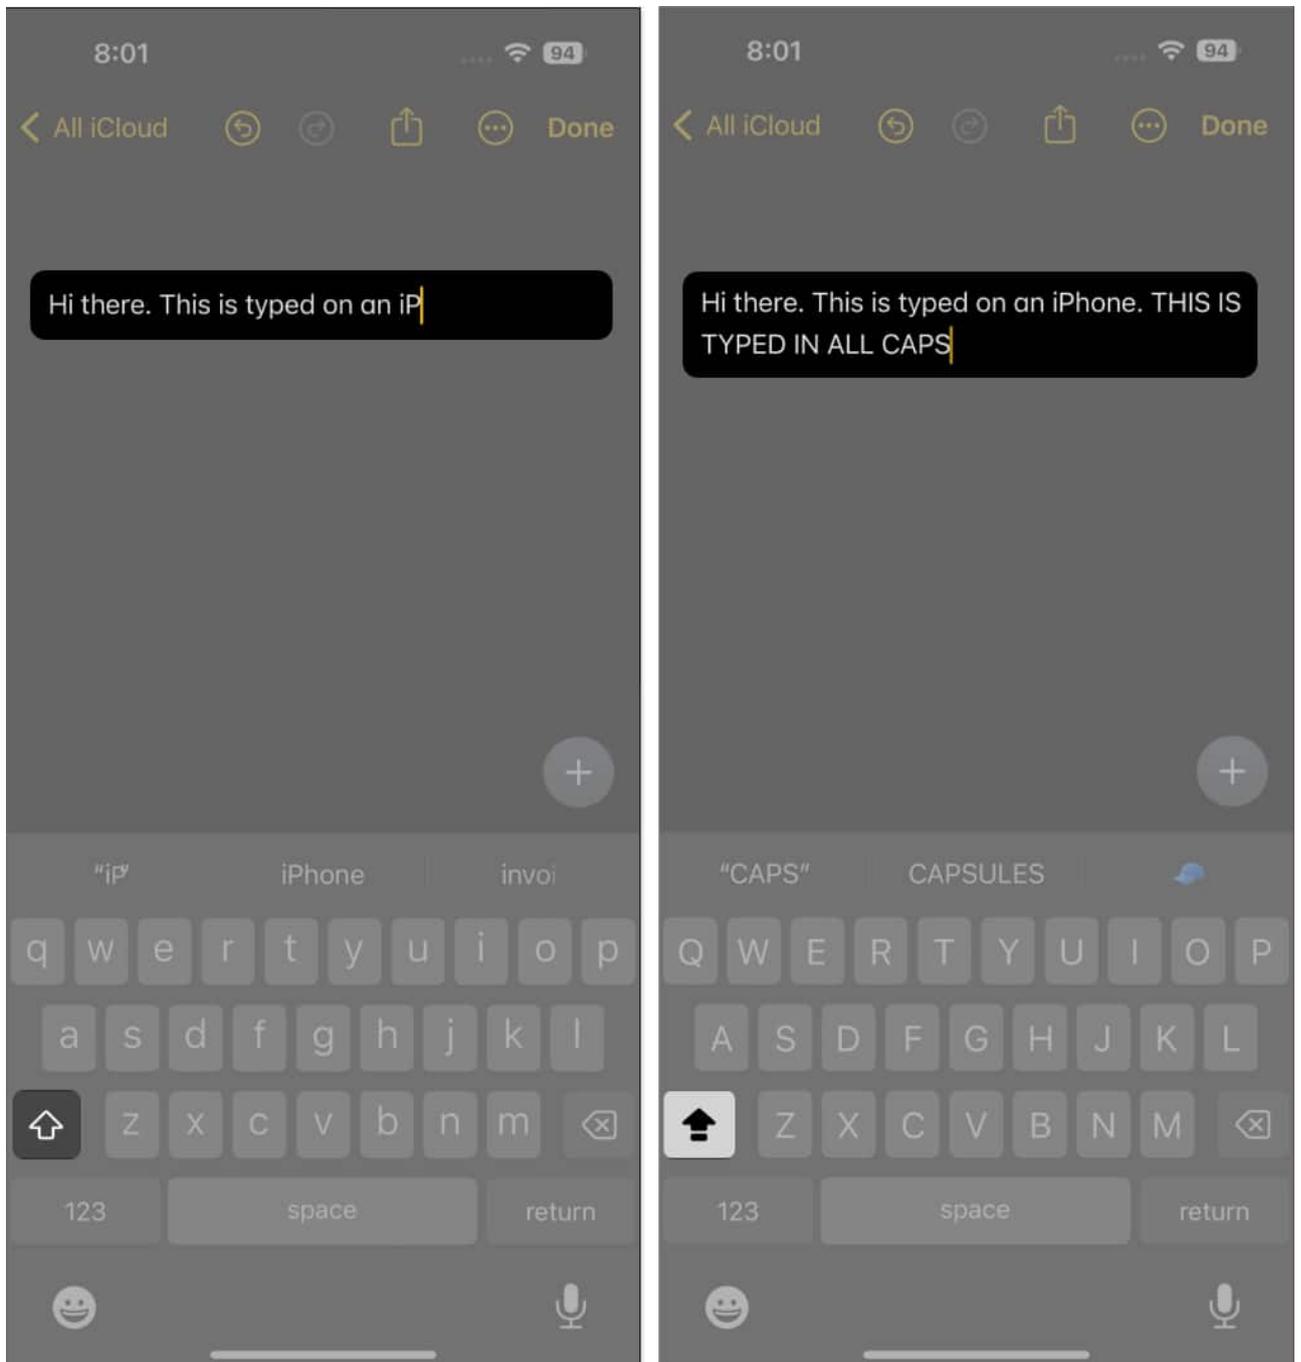

17. Easily capitalize words

Typing on your iPhone or iPad offers some flexible capitalization options, which can speed things up. Usually, you'd tap the Shift key and then tap the letter you want to capitalize.

But there's another way.

- **Capitalize one letter: Tap and hold the Shift key** → Without lifting your finger, **slide it to the letter** you want to be capitalized. Then release your finger to see the alphabet.
- **Capitalize all letters:** And if you need to type something in all caps, there's a shortcut for that, too. Just **quickly double-tap the Shift key**. This will activate the Caps Lock, allowing you to type in uppercase without pressing the Shift key for each letter.

18. Access numbers and punctuation without switching keyboards

Typing numbers or symbols on your iPhone or iPad keyboard usually involves a bit of back

and forth.

Typically, you'd tap the **123 button** to switch to the numeric and symbols keyboard, select your desired character, and then tap **ABC** to return to the letter keyboard.

But there's a much simpler way to do this without the hassle of switching keyboards. Here's how:

1. Tap and hold the **123 button**.
2. Without lifting your finger, **slide it to the number or symbol** you need.
3. Once you release your finger, the keyboard automatically switches back to the letters.

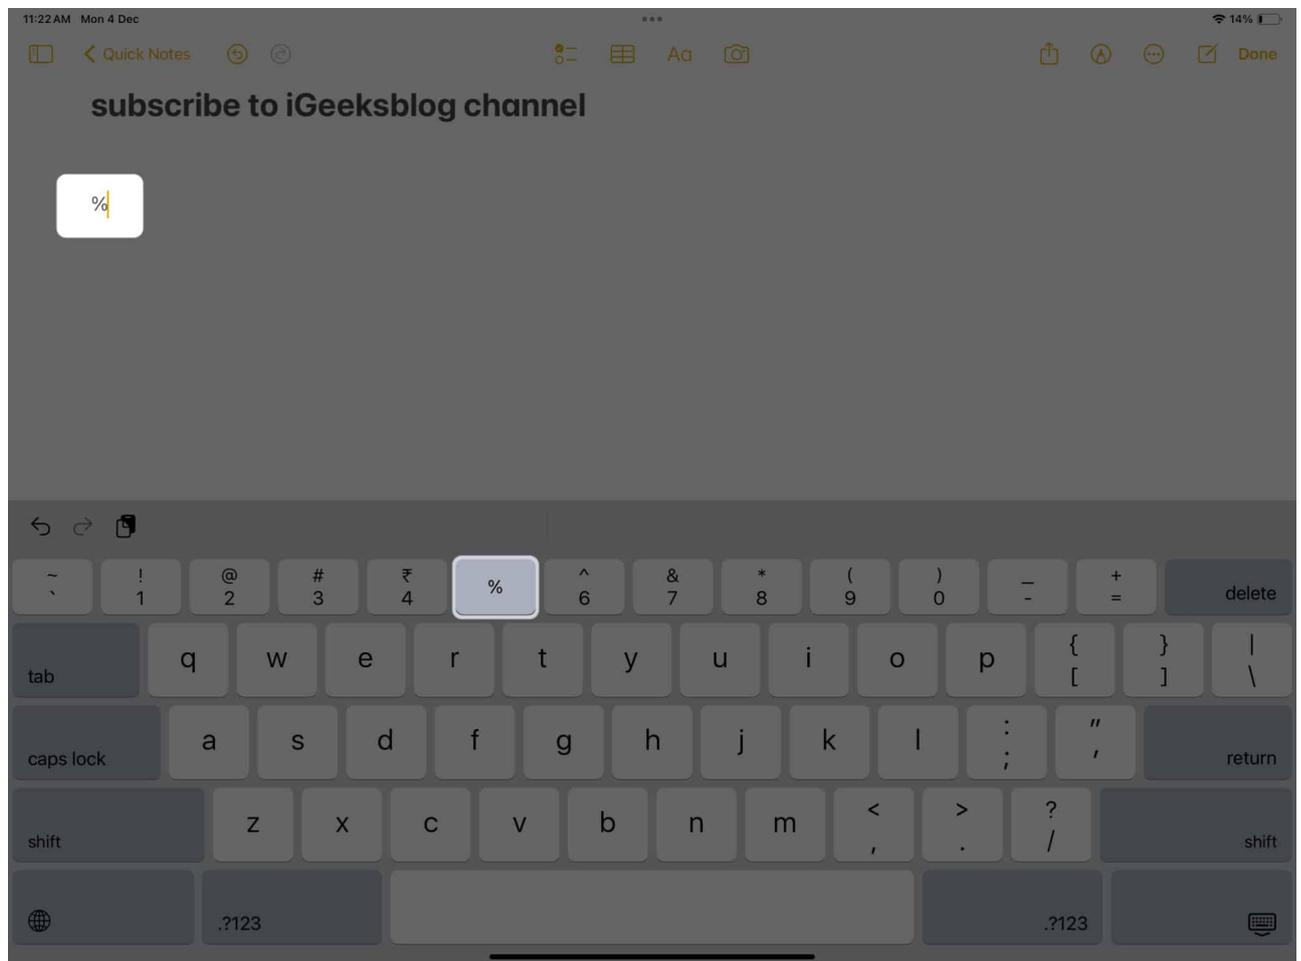

This quick swipe method lets you insert numbers and symbols easily, streamlining your typing and making it more efficient.

19. Use the nifty key flick feature (iPad keyboard trick)

The iPad's larger keyboard has a nifty feature introduced in iOS 11 called [Key Flicks](#). This feature is especially handy for quickly typing numbers and symbols without the hassle of switching between different keyboards.

Here's how it works:

- On the iPad keyboard, you'll notice that each key has a gray character on top of the darker one.
- To type the gray character (which could be a number or symbol), all you need to do is **swipe down on the key**.

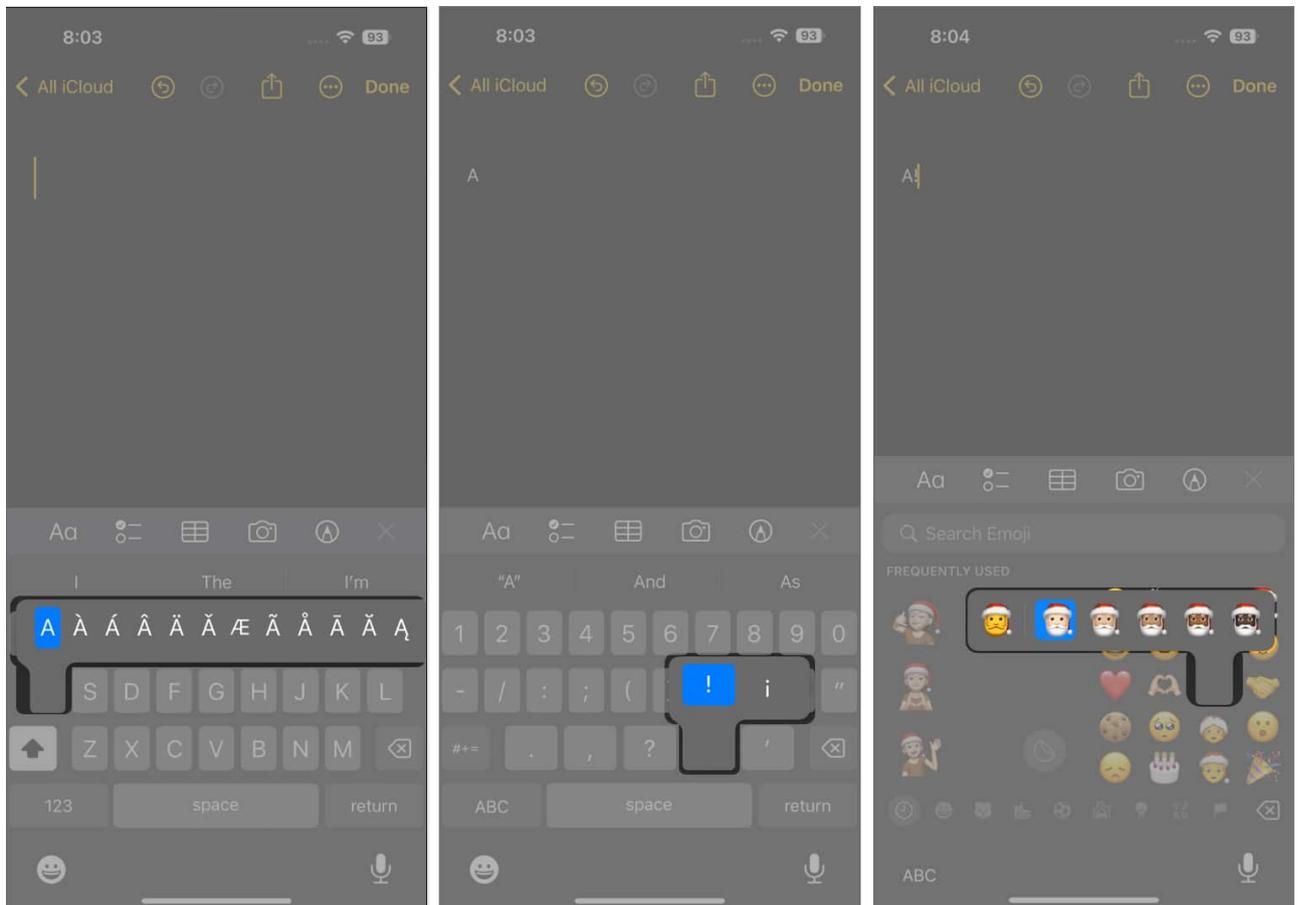

- This simple gesture lets you enter the gray character instead of the black one.

20. Get more character options

If you ever need to type accented letters or special punctuations that aren't commonly used in English, your iPhone or iPad keyboard has a simple solution.

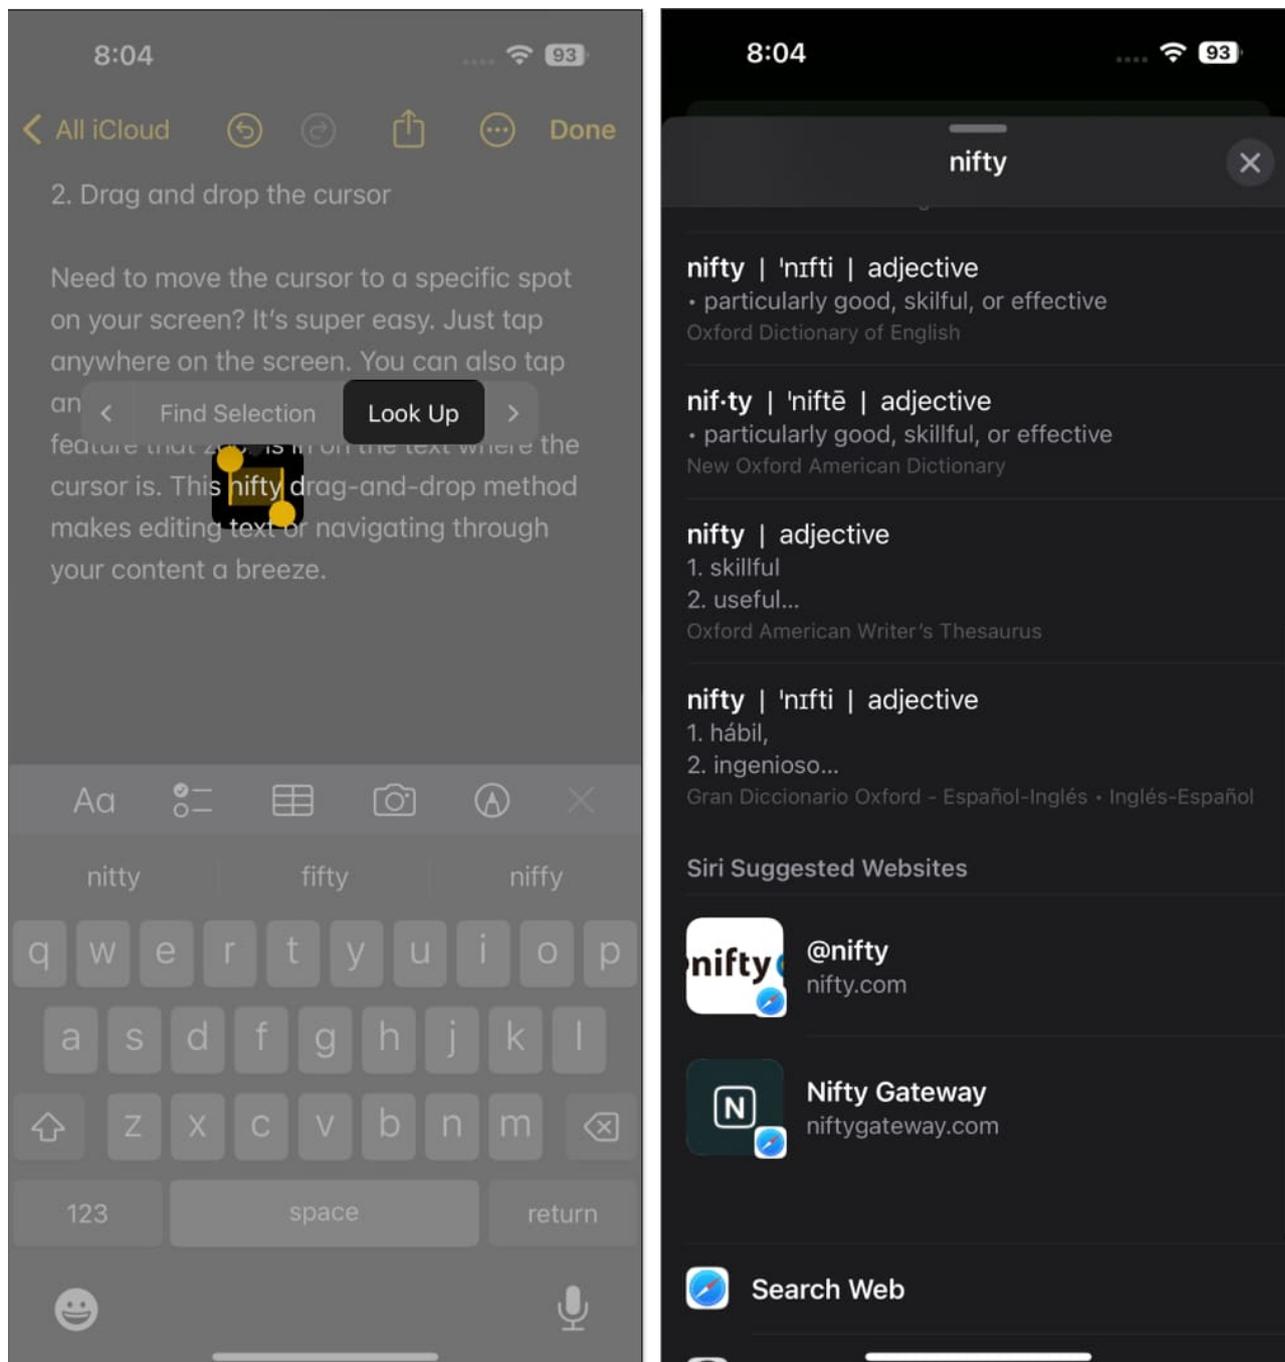

- Just **tap and hold on to the letter**; a menu will pop up showing all the available variations for that letter, including accents and other diacritical marks.
- This feature also applies to emojis, particularly those representing people. You can select different skin tones if you tap and hold these emojis.

21. Instantly lookup for words on your iPhone

You don't have to leave the current app you're in to look for a word's definition.

- All you need to do is **select the word** → tap **Lookup** in the popup menu.
- This trick also works in Safari and while reading a book in the Books app.

22. Try Landscape mode on iPhone or iPad

This might seem like a silly iPhone keyboard tip, but it often goes under the radar.

Apple allows the iPhone and iPad keyboards to function in landscape mode, providing a

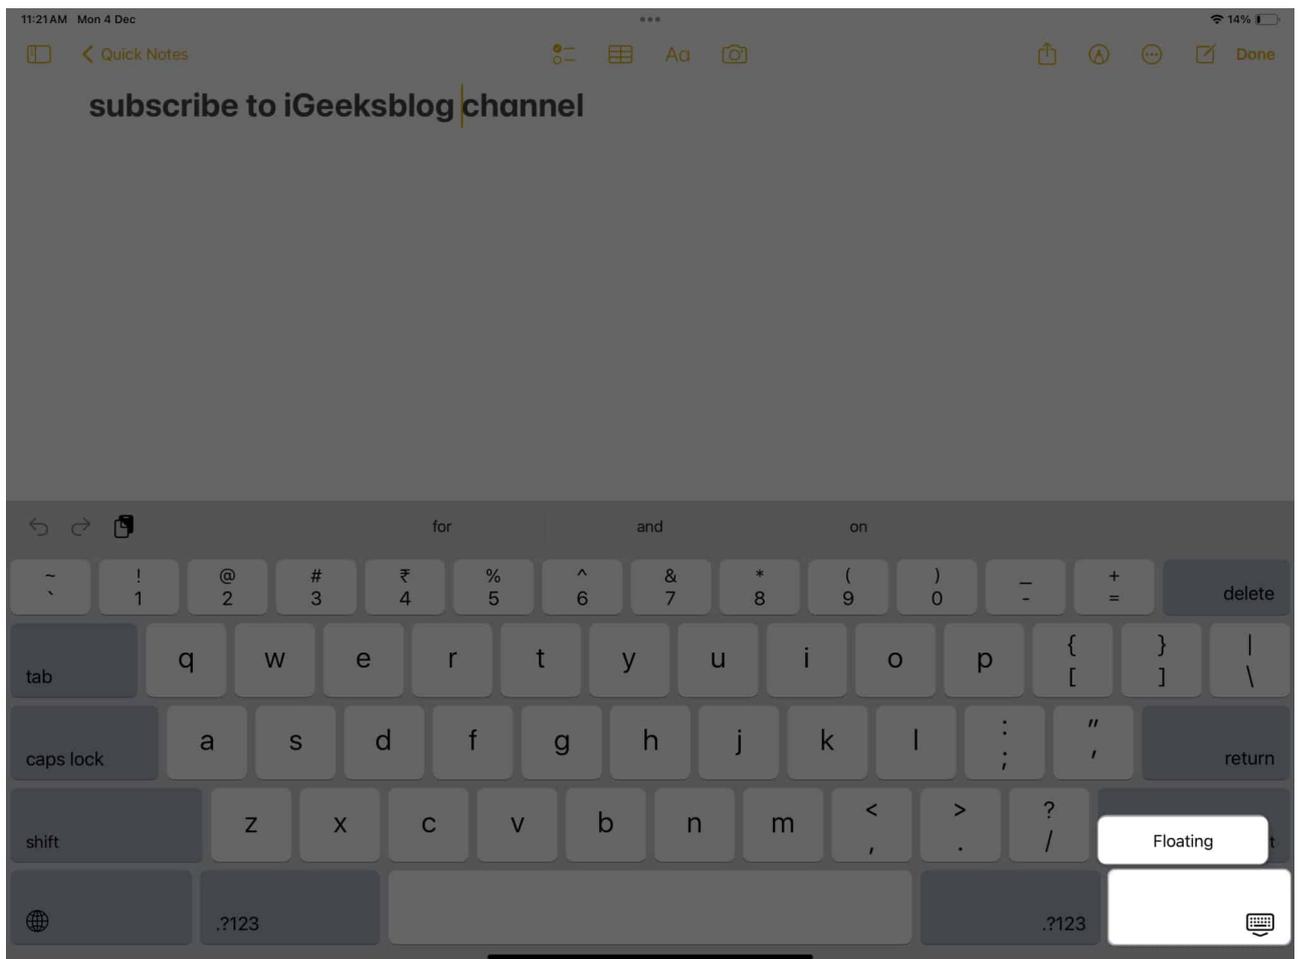

wider layout when the phone is turned **sideways**.

This feature is excellent for those who prefer a larger keyboard, making typing more manageable and comfortable.

23. Pinch, Shrink, or Move Keyboard (iPad keyboard trick)

Your iPad's keyboard typically shows up on the bottom of the screen. But unlike the iPhone, you have the freedom to move it anywhere on the screen.

1. Undock your keyboard by touching and holding the **small keyboard icon at the bottom right** of the keyboard.
2. Then select **Floating** → **Drag the keyboard** anywhere on the screen.

- You can also use the pinch gesture using two fingers to shrink the keyboard and make the pinch-out gesture to turn it back to its original size.
- You can also split the keyboard into two by making the pinch-out gesture with your two fingers from the center of the keyboard.

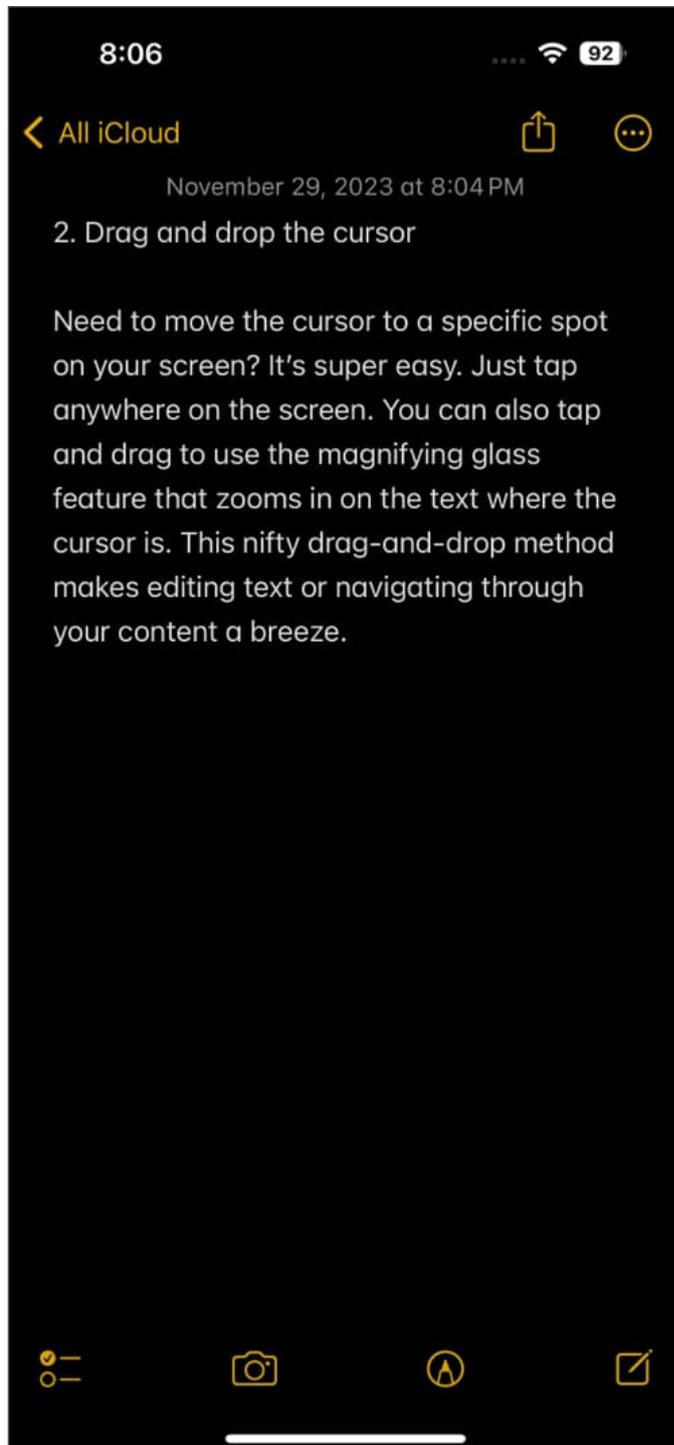

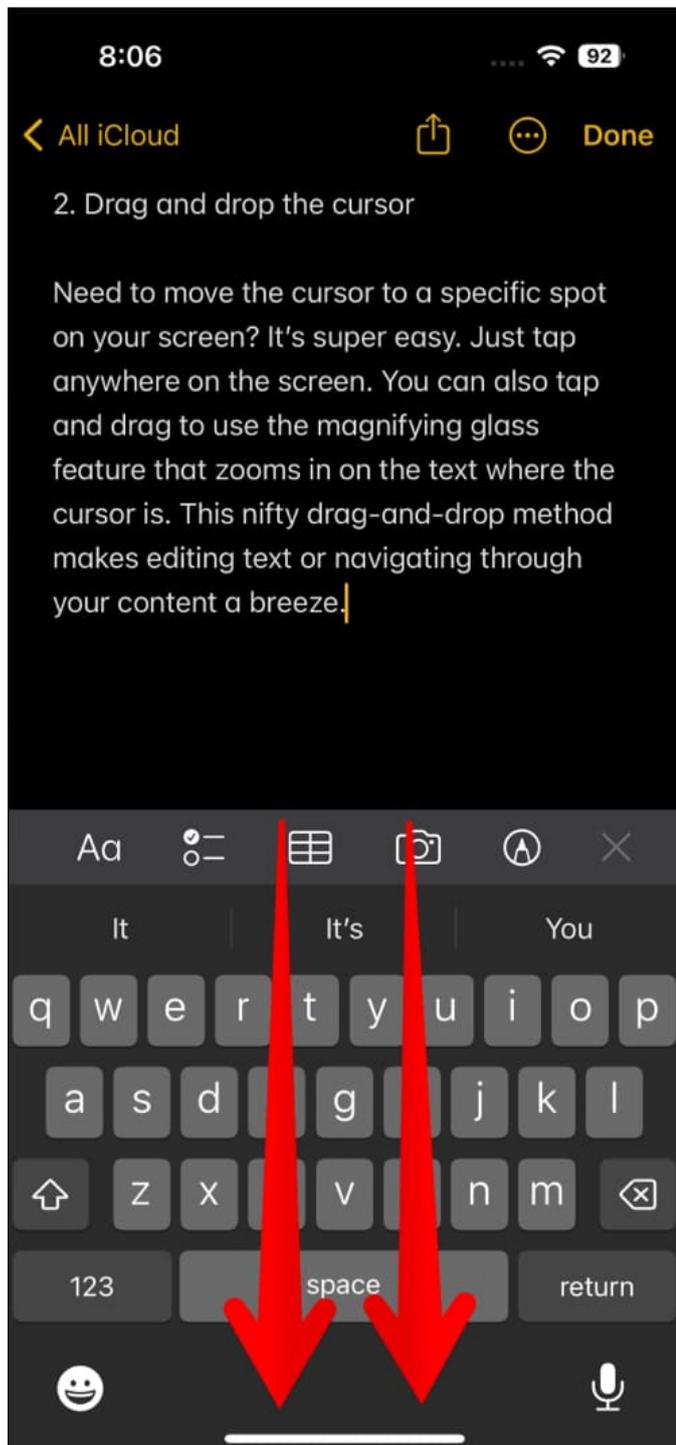

Note

To get the Floating keyboard back to normal, just drag the gray bar to the bottom of your screen.

24. Hide Keyboard on your iPhone

Sometimes, the keyboard might appear when you don't want it to, taking up screen real estate and blocking your view of whatever's on your screen.

Get rid of the keyboard by **swiping down from the center** of your iPhone or iPad's display screen (not the keyboard).

25. Install custom fonts

In addition to using emojis to express yourself, you can also install custom fonts on your iPhone or iPad to add more personality to your messages.

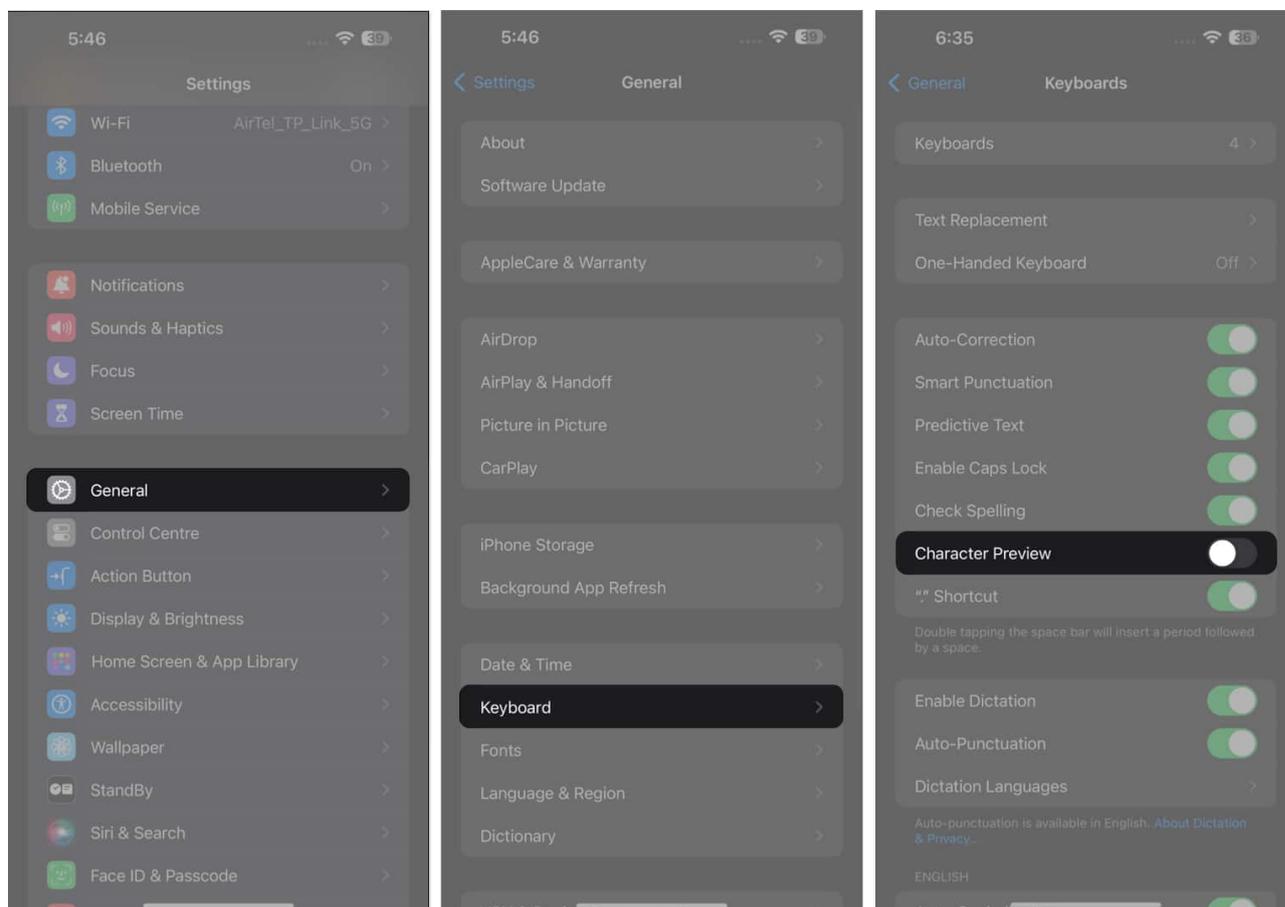

Here's [everything you need to know about installing custom fonts on your iPhone or iPad](#).

26. Disable the popup character preview

So far, we've talked about enabling tips for the iPhone keyboard. So, how about disabling something to improve your experience?

Whenever you type on your keyboard, you'll see a tiny popup called character preview, which shows you the letter you're about to type. If you want to get rid of it:

1. Head to **Settings** → **General** → **Keyboard**.
2. Toggle off **Character Preview**.

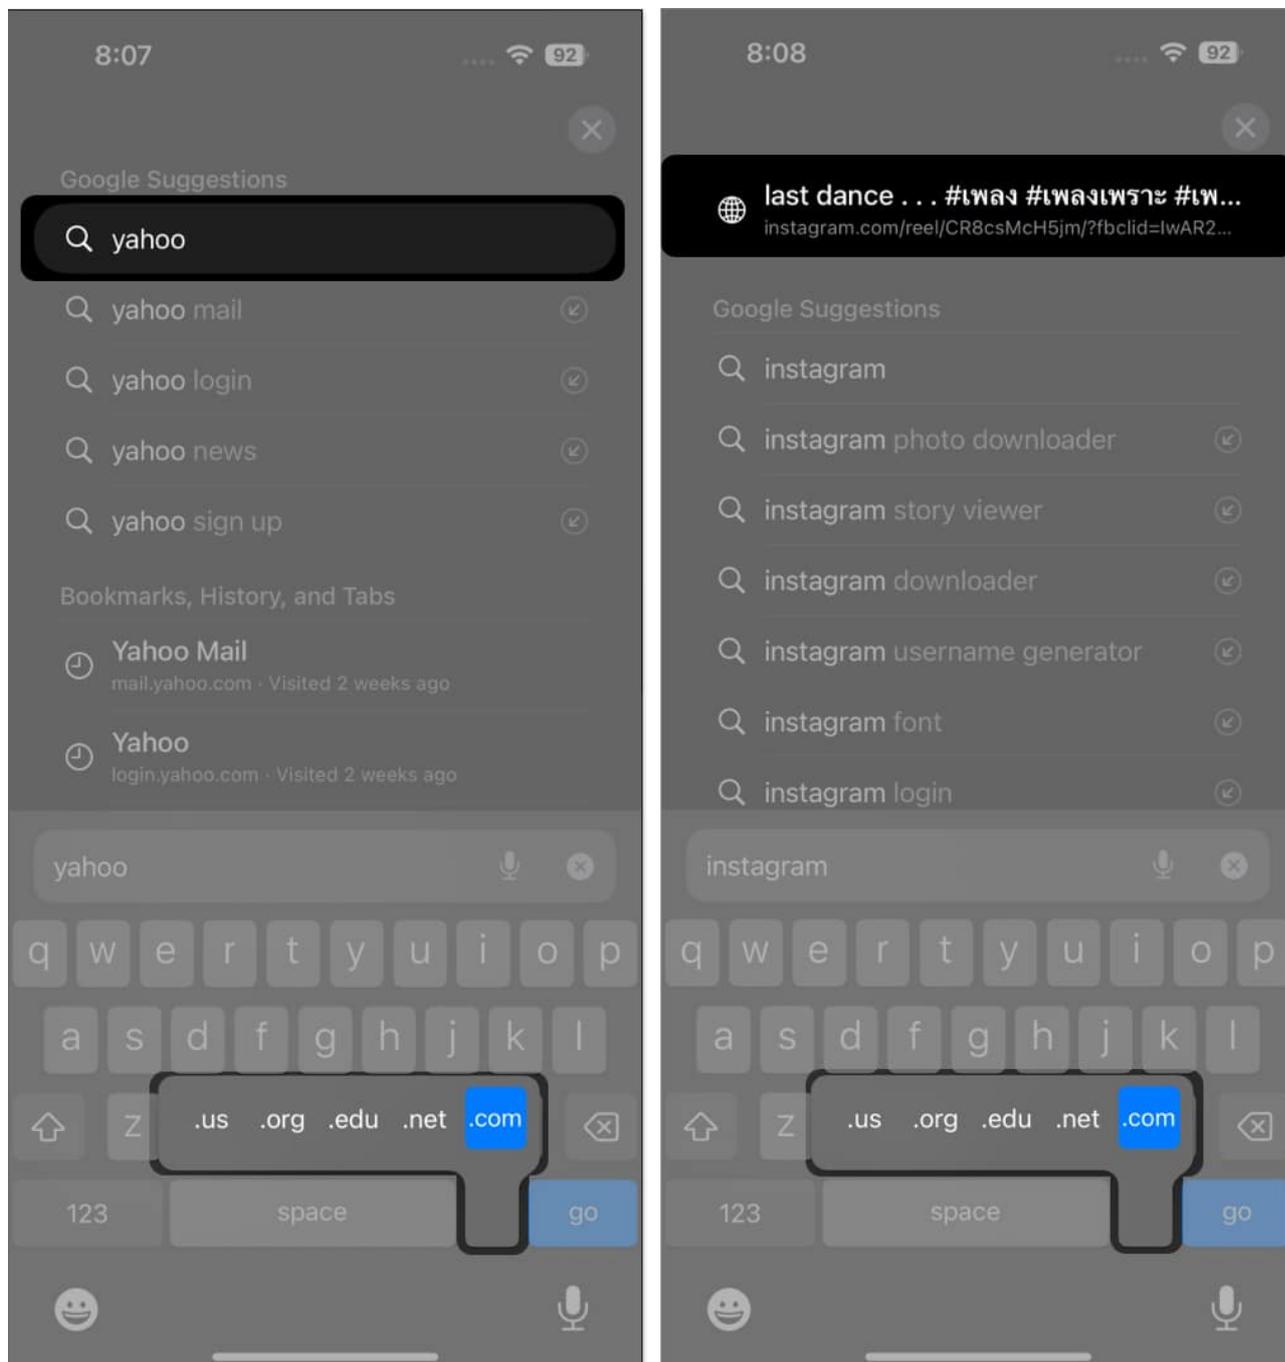

27. Shortcuts on the iPad keyboard

Another cool thing about the iPad keyboard is the ability to use keyboard shortcuts. Keyboard shortcuts let you quickly access apps and take action on your iPad without relying on buttons and gestures. Here's a [complete list of all the keyboard shortcuts you can use on the iPad](#).

28. Enter the domain address faster

Another nifty trick lets you type a website's domain address faster.

1. All you need to do is open a **web browser** → Head to the **search/address bar** → Type in the **site's name**.
2. Enter the **period** → Hold it until a popup menu with a selection of top-level domains (TLDs) such as *.com*, *.edu*, *.org*, and more appears.
3. Swipe to the desired TLD, and you're done!

That's it!

Now that you're equipped with all these smart iPhone keyboard tricks, you're ready to elevate your typing experience. These tips are designed to make typing more efficient and enjoyable - or, at the very least, to make it less of a hassle for your fingers.
